NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletions and/or chemical or feature treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been distributed. Tests shall also be taken at any time that communication is suspected or when requenced by the Division.

Commanced at (hour, date) **

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall needly the Division in writing of the exact time the test is so be commenced. Offset operators shall also be so notified.
- 3 The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more shan went dark.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains thut-in. Such test shall be continued for seven data in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the automphete due to the lack of a pijeline connection the flow period shall be three hours.
- 3. Following completion of Now Ten No. 1, the well shall again be shut-in, in secondance with Paragraph 3 above.
- 6. Flow Tent No. 2 shall be conducted even though too leak was indicated during Flow Tent No. 1. Encedure for Flow Tent No. 2 is to be the same as for Flow Tent No. 1 except

- that the previously produced some shall remain that in while the some which was previously shut in it produced.
- 7. Prestures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: I hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period, Other pressure may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hout oil some term: all pressures, throughout the entire tern, shall be continuously measured and seconded with seconding pressure gauges the accuracy of which must be therefore at least rwice, once as the beginning and once as the end of each tern, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as required above being taken on the gas some.

B. The results of the above-described sess shall be filed in triplicate within 1) days after completion of the tent. Tents shall be filed with the Aster District Office of the New Meson Oil Conservation Division on Northwest New Meson Packet Leakage Test form Revise 10-01-78 with all dead-eight pressures indicated thereon as well as the flowin temperatures (gas zones only) and gravity and GOR (oil zones only).
