Commingling Application for the Jack Frost B No. 1E
615' FSL x 810' FWL Section 27, T27N, R10W, San Juan County, New Mexico

Amoco Production Company requests approval to commingle production from the Angels Peak Gallup and Basin Dakota pools in the subject well. This commingling will utilize a production packer set between the two zones at 5920' and a sliding sleeve set at 5832' to produce up a 2-3/8" tubing string landed at 6509'.

The commingling of the Gallup and Dakota is necessary because of the low producing rates in the Gallup. After an extended completion period lasting eight months, the Gallup would produce an average of only 225 MCFD and 2 BOPD. To obtain this prodution rate it was necessary to swab the well several times daily. It is assumed the well will not produce by flowing and it will be necessary to utilize the energy in the Dakota to lift the hydrocarbons. Therefore, the only way to produce the zone is by commingling with the Dakota production. The proposed commingling will not adversely affect either zone for the following reasons.

1. Neither zone at the present time produces any formation water. The Gallup did produce some water during swab and flow operations but from water analysis it is shown that this was load water (see Attachment 12).

2. Neither zone has a history of sensitivity to liquid hydrocarbons and should not be damaged by either zone's condensate production.

3. Several offsets have had good success in the downhole commingling of both zones, the most recent being the commingling of Dugan Production Company's McAdams No. 3, Order No. R-5313 one mile to the southeast (see Attachment 2).

4. Since both zones produce gas of approximately the same composition, there will be no loss of value as a result of the commingling.

5. Both zones have common ownership, so there will be no problems in allocating royalty or working interest payments.

6. The bottom hole pressure of the Gallup is 48.1 percent that of the Dakota adjusted to a common datum. While that is 1.9 percent below that set down in NMOCD Rule 303C Order No. R-6882, we submit that this will not adversely affect production due to crossflow for the following reasons:

   a. The Dakota was shut in a total of one year two months following its completion 1-31-81. The zone was shut in while the Gallup was being worked over and completed and because stock tanks could not be drained due to bad roads caused by inclimate spring weather.

   b. Within a few months, this well will follow the production history of other infill Dakota wells in the area and production and bottom hole pressure will drastically decline in the Dakota.

   c. A 1.9 percent shortcoming in the Gallup BHP is within the margin of error in the method used to estimate Gallup bottom hole pressure. That method was to shoot a sonolog which indicated the top of the liquid and to use the Redlich-Kwong correlation to estimate the pressure to the top of the fluid level.

In compliance with NMOCD Rule 303C, "Downhole Commingling," please find attached two copies of each of the following:

Attachment No.	
1	"Well Location and Dedication Plat" (NMOCD Form C-102). The Gallup dedication plat is currently being processed.
2	Well location map showing location of all outside operated wells.
3	List of names and addresses of operators of all outside operated wells.
4	A complete well completion history (USGS Form 9-331, "Sundry Notices and Reports on Wells").
5	A complete engineering completion summary on both zones along with complete well test data on the Gallup.
6	NMOCD Form C-116 for the Dakota showing the results of a 168 hour flow test.
7	NMOCD Form C-116 for the Gallup showing the results of a 244 hour flow test. State rules require current (within 30 days) productivity tests. The Gallup test was taken

10-22-81 to 11-3-81. The well was flared for six days then shut in to the present time. Since the Gallup was shut in to the present, we request an exception to be granted to the 30-day limit required for the Gallup.

8 Actual bottom hole pressure taken for the Dakota and bottom hole pressure calculations for the Gallup adjusted to a common datum.

9 A copy of the gas analysis of produced gas from the Dakota.

10 A copy of the gas analysis of produced gas from the Angels Peak Gallup.

11 A copy of the letter sent to all offset operators and the Minerals Management Services notifying them of our intent to commingle.

12 Water analysis of load water from the Gallup zone.

To allocated production to the individual Gallup and Dakota horizons we recommend the following:

1. Allocate 19.68 percert of the gas production as shown on Form C-116 to the Gallup horizon.

2. Allocate 80.32 percert of the gas production as shown on Form C-116 to the Dakota production.

3. Allocate 6.9 percent of the oil production as shown on Form C-116 to the Gallup horizon.

4. Allocate 93.1 percent of the oil production as shown on Form C-116 to the Dakota horizon.

5. Test each zone 30 days after approval of commingling and submit a Form C-116 stating each zone's actual oil and gas productivity under commingling corditions and allocating each zone's production accordingly.

We would like to obtain approval for this well as soon as possible so that we can begin production. Your prompt handling of this matter is appreciated.

Sincerely,

D. W. Schroeder

STATE OF NEW MEXICO
ENERGY AND MINERALS DEPARTMENT

P. O. BOX 2088
SANTA FE, NEW MEXICO 87501

ATTACHMENT NO. 1

Form C-102
Revised 10-1-78

All distances must be from the outer boundaries of the Section

Operator	Lease	Well No.
AMOCO PRODUCTION COMPANY	JACK FROST "B"	1-E

Unit Letter	Section	Township	Range	County
M	27	27N	10W	San Juan

Actual Footage Location of Well:
615 feet from the South line and 810 feet from the West line

Ground Level Elev.	Producing Formation	Pool	Dedicated Acreage:
6158	Dakota	Basin Dakota	320 Acres

1. Outline the acreage dedicated to the subject well by colored pencil or hachure marks on the plat below.

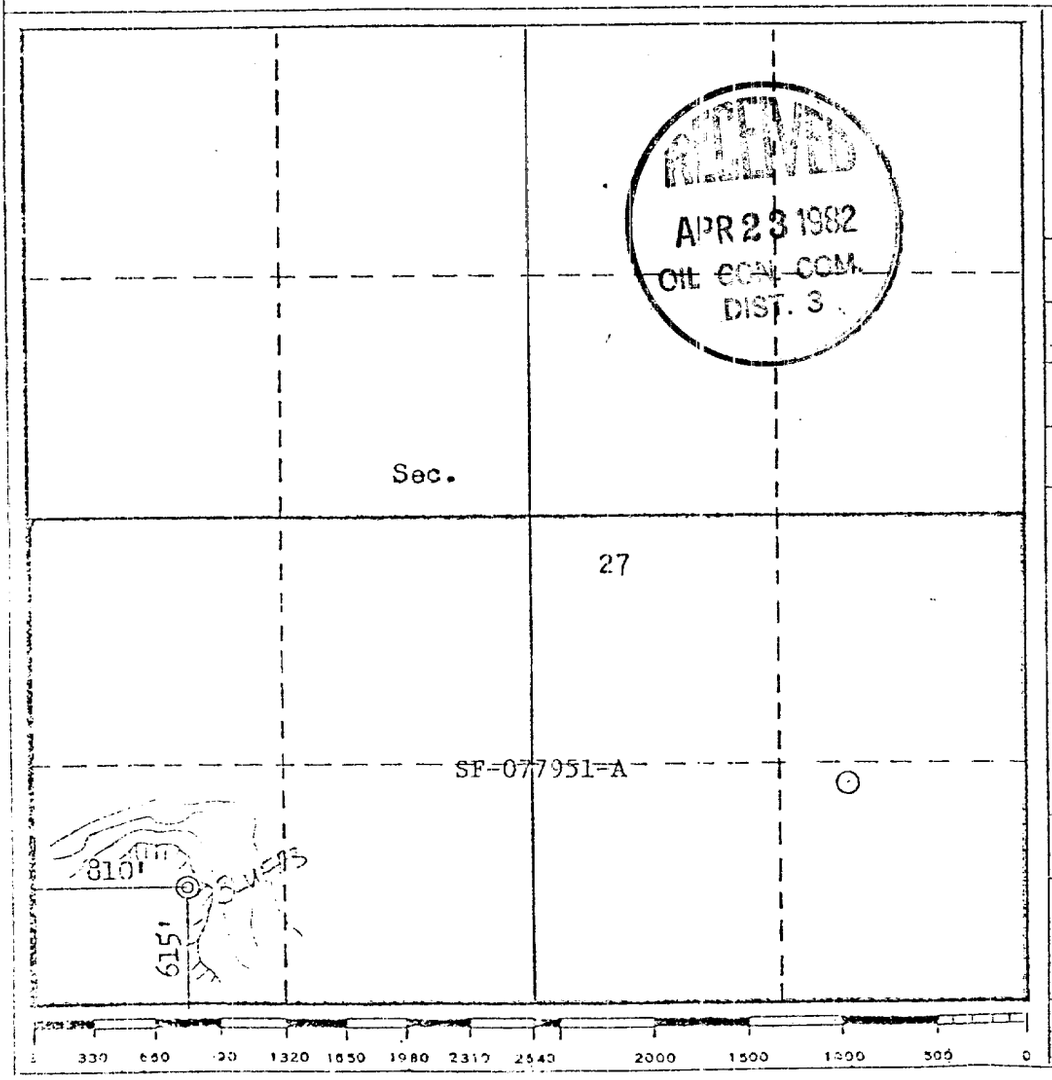
2. If more than one lease is dedicated to the well, outline each and identify the ownership thereof (both as to working interest and royalty).

3. If more than one lease of different ownership is dedicated to the well, have the interests of all owners been consolidated by communitization, unitization, force-pooling. etc?

☒ Yes ☐ No If answer is "yes," type of consolidation Communitization

If answer is "no," list the owners and tract descriptions which have actually been consolidated. (Use reverse side of this form if necessary.) _____

No allowable will be assigned to the well until all interests have been consolidated (by communitization, unitization, forced-pooling, or otherwise) or until a non-standard unit, eliminating such interests, has been approved by the Commission.



CERTIFICATION

I hereby certify that the information contained herein is true and complete to the best of my knowledge and belief.

No well will be assigned an allowable greater than the amount of oil produced on the official test.

During gas-oil ratio test, each well shall be produced at a rate not exceeding the top unit allowable for the pool in which well is located by more than 25 percent. Operator is encouraged to take advantage of this 25 percent tolerance in order that well can be assigned increased allowables when authorized by the Division.

Gas volumes must be reported in MCF measured at a pressure base of 15.025 psia and a temperature of 60° F. Specific gravity base will be 0.60.

Report casing pressure in lieu of tubing pressure for any well producing through casing.

Mail original and one copy of this report to the district office of the New Mexico Oil Conservation Division in accordance with Rule 301 and appropriate pool rules.

I hereby certify that the above information is true and complete to the best of my knowledge and belief.
