As a by-product of the empirical procedure, allowing the Robinson-Jordan data treatment to be applied to any data set, we should like to show the general form of the χ^2 function for a set of N data points, y_i , and N parameters, x_j . The χ^2 function is defined as

view of the fact that the two groups were not shown the same information, the results of this experiment can be regarded to be satisfactory. There is one important question for removal from the subject's mind, and that is, could the two groups be separated out on the basis of their own feelings? The answer to this question is, of course, no. The subjects were not able to tell which group they were in, and they were not able to tell which group was better. The results of this experiment are, therefore, very satisfactory.
