## NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

An exist casally rest shall be commenced on each multiply completed well within soven cass after actual completion of the well, and crinically thereafter as prescribed by the order audit rizing the hultiple completion. Such tests shall also be commenced on all multiples actuals are within seven days following recompletion and or chemical or fracture treat near and whenever remedial work has been done on a well during which the packer or the troad may be remedial. Tests shall also be taken at any time that communication is supported to when the sevend by the Division.

- 2.—At a ast 72 yours prior to the commencement of any packer leakage test, the operator shall nouts the Dysis in an writing of the exact time the test is to be commenced. Offset operators stadials on a son, so notafied.
- 3. The packet reasage test shall commence when both zones of the dual completion are shuten for pressure standization. Both zones shall remain shutein until the well-head pressure in even tase, andized provided however, that they need not remain shutein more than second days.
- 4. For low lost N. I one zone of the dual completion shall be produced at the normal rate of production by the the other zone remains shut-in. Such test shall be continued for sever dues in the case of a gas well and for 24 hours in the case of an oil well. Note iff on an initial visitor teak go test a gas well as semigliflowed to the atmosphere due to lack of a pipeline connection the flow period shall be three facility.
- $S=4\,\sigma$  of the configuration of flow Test No. 1, the well shall again be shut-in, in accordance with Paraschott state (
- $e=11.5~(8s)~N_{\odot}$  ) shall be conducted even though no leak was indicated during Flow Lest No. 1. Projective for Flow Test No. 2.3s to be the same as for Flow Test No. 1 except

that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 4 lours tests immediately prior to the beginning of each flow period, at fifteen-mirrute intervals during the first hour thereof and at hour your measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period at least one time during each flow period at approximately the midway point and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests, all pressures, this aghout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil wine only, with deadweight pressures as required above being taken on the gas zone.

8 The results of the above-described tests shall be filled in triplicate within 15 days after completion of the test. Tests shall be filled with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage fest from Revised 16-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity are GOR (oil zines only).
