#### NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual etion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that unication is suspected or when requested by the Divisi

- 2. At least 72 hours prior to the commencement of any packer test, the operator shall notify the Division in writing of he exact time the test is to be commenced. Offset operators shall also be notified.
- Packer leakage tests shall commence when both some of the dual completion are shut in for pressure stabilization. Both somes shall remain shut in until the well-head pressure in each has stabilized, provided however, that they need not remain shut in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production whale the other zone remains shad-in. Such test shall be continued for even days in the case of a gas well and for 34 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- S. Pollwing completion of flow Test No. 1, the well shall again be shut in, in accordance with Paragraph 3

- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except that the previously produced some shall remain shut-in while the zone which was previously shut-in pre-
- 7. Pressure for gas some tests must be measured an each some with a deadweight pressure gauge at time intervals as follows: 3 hours test: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point). and immediately prior to the conclusion of each flow period. Other pressures on may be requested on wells which have previously shown questionable test data. may be taken as destred, or
- 24-hour of sone tests; all presource, throughout the entire test, shall be continuously mean recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is gas-off or a of gas dual completion, the recording gauge shall be required on the off zone only, with deadweight pressures as required above being taken on the gas some.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after the completion of the test. Tests shall be filed with the Aster District Office of the New Mexico Off Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-76 with all deadweight pressure indicated thereon as well as the flowing temperatures (gas somes only) and gravity and GOR (of somes only).
