NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test small be commenced on each multiply completed well with n seven days after actual completion of the well, and annually thereafter as presembed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple complet ons within seven days following recompletion and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer of the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

Commenced at (hour, date)**

TIME

LAPSED TIME

- 2 At least 72 nears prior to the commencement of any packer, eakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shatt-in for pressure stabilization. Both zones shall remain shatt-in until the well-head pressure in each has stabilized, provided however, that they need not remain shatt-it more than a provider. than seven days
- 4 For Flow Test No. 1, one zone of the dual completion shall be produced at the normal 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note if on an initial packet leakage test, a gas well is being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three nours.
- 5 Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above
- o Flow Test No. 2 shall be conducted even though no leak was indicated during. Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1. exce

- that the previously produced zone shall, errorn shut-in while the zone wall, i.e. is it to least
- Pressures for gas-zone tests must be measured on each zone with a madiverant pressure gauge at time intervals as follows. I hours tests immediately profit to the egone of each flow period, at fifteen-minute intervals during the first hour there it and at madiving the rest hour there it and at madiving of each flow period. Padas tests immediately prior to the negliating of a cut for so account of each flow period. Padas tests immediately prior to the negliating of a cut for spens at a feast one time during each flow period for approximately the midvay por mand atmeniates prior to the conclusion of each flow period. Other pressures may be taken as desired or may be requested on wells which have presiduately shown measures and active and atmeniates. I have tests all pressures throughout the entire test, shall be confluenced with recording pressure gauges the accuracy of which must be directed at least twice, once at the beginning and once at the end of each flow. In a deady-eight pressure gauge. If a well is a gas-oil or an original data completion, the recording gauge shall be required on the oil zone once, with deady-eight resistion is required above being taken on the gas zone.

s. The results of the above-described tests shall be filed in the leaf with 18 days are, completion of the test. Tests shall be filed with the Azie, District Offic, 19 the New Move Oil Conservation Division on Northwest New Mexico Packer Leusage 19 est fill at Recisc 19 601-78 with all deadweight pressures indicated thereon as we as the flowing temperatures (gas zones only) and gravity and GOR follower test sork).
