DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Rotary drilling equipment will be used to drill to approximately 5000' to the base of the Dakota formation with the possibility that drilling will be continued to the Devonian layer at approx. 11,000'. Casing program: conductor pipe 200' of 13-3/8" OD cemented to surface. Surface pipe 200' of 9-5/8" OD cemented to surface. Production pipe required amount of 10" to 7" depending on sufficient depth and nature of pay zones. Production casing to be cemented with sufficient cement to protect all pay zones. But program to consist of native sands to 1000' from 1000' to 3000' low solids oil sands and from 3000' to total depth a low solids oil emulsion mud. Electric logs, etc. will be run prior to setting production casing or abandonment of well. Stimulation treatments such as acidizing or fracturing may be employed in completion.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced
