NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packet teakage test shall be commenced on each multiple completed well within seven case after actual completion of the well, and annually increative as prescribed by the order author at my the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and or cremical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been distanced. Tests shall also be taken at any time that communication is suspected of when requested by the Division.
- 2. At least 72 Fours prior to the commencement of any packer leakage test, the operator shall notify the Davision in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in dutt, the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Fest No. 1, one zone of the dual completion shall be produced at the normal tate of production while the other zone remains shuts in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an ed well. Note if, on an initial packer leakage test a gas well is being flowed to the atmosphere due to lack of a probleme connection the flow period shall be three hours.
- 5 . Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 2 snall be conducted even though no leak was indicated during Flow. Lest No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shat-in while the zone which was previous shut-in is produced.
- Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as to lows. 3 hours tests immediately prior to the regioning of each flow period, at fifteen-minute intervals during the first hour thereof, and at handly intervals thereafter, including one pressure measurement immediately prior to the corollass to of each flow period. 7-day tests, immediately prior to the beginning of each flow period as least one time curing each flow period, at approximately the indivaty point and riminulately prior to the corollasion of each flow period. Often pressures may be taken as desired at may be requested on wells which have previously shown questionative test data.
- 24-hour oil zone tests, all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of earn test, with a deadweight pressure gauge. If a well is a gas-oil at an oil-gas dual completion, the recording gauge shall be required on the oil. At he oally with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico On Conservation Division on Northwest New Mexico Packer Leakage Test Form Respect 10-14-T8 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones on y) and gravity and JOR (oil zones only).
