NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order sutherizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletions and/or chemical or fixence treatment, and whenever temedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified,
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has trabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Now Test No. 1, one zone of the dual completion shall be produced at the normal tase of production while the other sone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage test, a gas well in leding flowed to the automphete due to the lack of a pipeline connection the flow period shall be three bours.
- 3. Talliming completion of Now Text No. 1, the well shall again be shut-in, in accordance with Parigraph 3 shore.
- 6. Those Tent'No. 2 shall be conducted even though no leak was indicated during How Jen No. 1, Encedure for Dero Ten No. 2 is to be the same as for How Len No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previoly shut-in it produced.
- 7. Pressures for gastione term must be measured on each sonte with a deadweignessure gauge at time intervals as follows: I hours terms immediately prior to the beging of each flow-period, at Intern-minute intervals during the first hour thereof, and housh intervals thereafter, including one pressure measurement immediately prior to conclusion of each flow period, 7-day terms; immediately prior to the beginning of efflow period, at least one time during each flow period (at approximately the midpoint) and immediately prior to the conclusion of each flow period. Other pressures to be taken as desired, or may be requested on wells which have previously shown qualionable test data.
- 26-hour oil sone texts; all pressures, throughout the entire test, shall be continuous measured and recorded with recording pressure gruges the accuracy of which must checked at tean twice, ower at the beginning and over at the end of each text, with deadweight pressure gruge. If a well is a gas-oil of an oil-gas dual completion, the recording gruge shall be required on the oil sone only, with deadweight pressure as requisioned being taken on the gas sone.
- 4. The results of the above-described resustabilities filed in triplicate within 13 days a completion of the test. Tests shall be filed with the Accer District Office of the New Me Oil Conversation Division on Northwest New Mesko Packet Leakage Test Islam Acc 10 01-78 with all dead-eight pressures indicated theiron as well as the flottemperatures (gas sones only) and gravity and GOR (oil sones only).
