NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within severe days after actual completion of the well, and annually thereafter as prescribed by the order authororing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and or chemical or flucture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Disson in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leavage test shall commence when both zones of the dual completion are shall infor pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each his stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Pest No. 1, and zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven cass in the case of a gas well and for 24 hours in the case of an oil well. Note, if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to lack of a pinchine connection the flow period shall be three fours.
- 5 Following completion of Flow Test No. 1, the well shall again be shut-in in accordance with Paragraph 3 above.
- 9 Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shart-in while the zone which was x(x) -association is produced
- 7. Pressures for gas-zone tests must be meast red on each zone with a deadwill a pressure gauge at time intervals as follows. 3 hours tests, in mediates prior to the reconstruct of each flow period, at fifteen-minute intervals during the first nour flortest and at both intervals thereafter, including one pressure measurement immediately prior while unclass of or each flow period. Talay tests immediately prior to the beginning of each flow new dual least one time caring each flow period (at approximately the midway point, and materials prior to the econolision of each flow period. Other pressures may be taken as desired of may be requested on wells which have previously shown questionable test data. 2 (hour oil zone tests, all pressures, throughout the entire test, shall be common assistances).
- 2 (shour oil zone tests) all pressures, throughout the entire test, shall be an atmost as measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only with deadweight pressures is required above being taken on the gas zone.
- S.—The results of the above-described tests shall be field in triplicate with a 15 days after completion of the test. Tests shall be filed with the Azteo District Office of the New Mexic Oil Conservation Division on Northwest New Mexice Packer Leasage Test Furn Reused 1, 91-78 with all denaweight pressures indicated thereon is well as the flowing temperatures (gas zones only) and gravity and GOR real zones only.
