San Juan County, New Mexico

Gentlemen:

The annual deliverability test data taken in May for the above captioned well indicate a serious problem exists in the well.

The productivity of the well in 1965 indicated an ability to produce 1528 MCF per day against a calculated pressure of 516 psi.

The productivity in May of 1966 indicated an ability to produce 43 MCF per day at a calculated pressure of 479 psi.

We suspect that the well has a casing failure in the Menefee section of the Mesaverde formation. Other wells in the area have had similar failures.

We suggest that remedial action be commenced immediately before the well is lost.

If we can be of assistance please contact us.

Yours very truly,

A. R. Kendrick
Engineer, District #3
