NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within
 seven days after actual completion of the well, and annually thereafter as prescribed by the
 order authorizing the multiple completion. Such tests shall also be commenced on all
 multiple completions within seven days following recompletion and/or chemical or fractire treatments, and whenever remedial work has been done on a well during which the
 pactiest or the turbing have been distrashed. Tous shall also be taken at any time that onsemissaction is suspected or when requested by the Division.
- At least 72 hours print to the commencement of any packer leakage test, the operator shall notely the Division in wrong of the exact time the test is to be commenced. Office operators shall also be so oscified.
- 3 The packer leakage test shall commence when both somes of the dual completion are shut-in for pressure stabilization. Both somes shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the aimosphere due to the lack of a pipeline connection the flow period shall be three boars.
- 5. Following completion of Plow Ten No. 1, the well shall again be shur-in, in accordance with Paragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in as produced.
- 7. Pressures for gas-zone sens roust be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours sens: immediately prior to the beganing of each flow-period, at faircen-manute intervals during the first hour, phenof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, at least one time during each flow period, at least one time during each flow period, at least one time during each flow period. Other possesses may be taken as durined, at may be requested on wells which have previously shown questionable can done.
- 24-hour oil sone tons: all pressures, throughout the entire tons, shall be emmissionally measured and recorded with recording pressure gauges the accuracy of which must be checked at least roice, once at the beginning and once at the end of each test, with a decisively in pressure gauge. If a well is a gas-oil of an oil-gus dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
