NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage sext shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all routisple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been distracted. Tests shall also be taken at any time that communication is suspected of when requested by the Division.
- At least 72 hours prior so the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are share in for previour stabilization. Both zones shall remain shart-in until the well-head pressure in each has stabilized, provided however, that they need not remain short-in more than given days.
- 4. For Flow Test No. 1, one sone of the dual completion shall be produced at the normal rate of production while the other sone remains short-in. Such test shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced some shall remain shun-in while the some which was previously shur-in is produced.
- 7. Pressures for gas-zone resu must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-massure intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day sess: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil some texts: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accusacy of which must be checked at least rovier, once at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures at required above being taken on the gas some.

8. The results of the above-described tests shall be filed in triplicate within 19 days after completion of the test. Tests shall be filed with the Aster Dutters Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leskage Test Form Revised 10-01-78 with all described pressures indicated thereon as well as the flowing temperatures (gas about only) and gravity and GOR (oil swort only).
