## NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer inskage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

Commenced of Shout, date) ##

- At least 72 hours prior to the commencement of any packer leukage test, the operator shall notify the Division in writing of the emer time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage tent shall commence when both somes of the dual completion are shut-in for pressure mabilization. Both somes shall remain shut-in until the well-head pressure in each has mabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one some of the dual completion shall be produced at the normal rate of production while the other zone remains shur-in. Such tent shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage tent, a gas well is being flowed to the samosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following complexion of Piou Tex No. 1, the well shall again be short-in, in accordance with Paragraph 3 above.
- 6. Plow Test'No. 2 shall be conducted even though so leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is so be the name as for Flow Ten No. 1 encept

- that the previously produced 2000 shall remain share-in while the 2000 which was previously shar-in as produced.
- 7. Pressures for gas-zone sero must be measured on such zone with a dendweigh pressure gauge at time intervals as follows: I hours testo: introcliately prior to the begans any of each flow-period, at fafteen-masure intervals during the fast hour thereof, and a hourly intervals thereofer, including one pressure measurement introcliately prior to the conclusion of each flow period. 7-day usus: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midwe posts) and immediately prior to the conclusion of each flow period. Other pressures me to take as desired, or may be requested on wells which have previously shown questionable test does.

24-hour oil some some: all pressures, throughout the entire son, shall be continuously measured and securided with recording pressure gauges the accuracy of which must be checked at least rovice, once or the beginning and once or the end of each out, with deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the revorting gauge shall be required on the oil some only, with deadweight pressures as require above being traken on the gas some.

8. The results of the above-described tests thall be filed in triplicate within 13 days afte completion of the test. Tests shall be filed with the Aztre District Office of the New Meast Oil Conservation Division on Northwest New Measte Packer Leakage Test Form Revise 10-01-78 with all deadweight pressures indicated thereon as well as the flower temperatures (gas 20000 only) and gravity and GOR (oil 20000 only).
