NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

 A packer leakage sext shall be commenced on each multiply completed well within seven days after acreal completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all raultiple completions within seven days following recompletion and/or chemical or fracrure treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been distracted. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

ad at Dane, dated # \$

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced, Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shut-in for previous stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than given does.
- 4. For Flow Text No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such use shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial pather leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 obove.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is to be the same as for Flow Text No. 1 except

that the previously produced 2000 shall remain shot-in while the 2000 which was previously shot-in is produced.

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at houtly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, at may be requested on wells which have previously shown questionable test data.

24-hour oil sone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least rwice, once as she beginning and once at the end of each sate, with a deadweight pressure gauge. If a well is a gus-oil or an oil-gas dual completion, the recording gauge shall be required on the oil sone only; with deadweight pressures as required above being taken on the gas sone.

8. The results of the above-described sess shall be filed in triplicate within 13 days after completion of the text. Tests shall be filed with the Asset Dutter: Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Text Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas somes only) and gravity and GOR (oil somes only).
