NORTHWEST NEW NEDOCO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage unit shall be connecered on each multiply completed well within seven dave after across completion of the well, and anomally thereafter as prescribed by the order authorizing the multiple completion. Such uses shall also be commenced on all multiple completions within seven dave following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the rathing have been disturbed. Tests shall also be taken as any time that communication is suspected or when requested by the Division.

d at Press, date) * *

- At least 72 hours prior to the enumenement of any packer leakage test, the operator shall notify the Division in writing of the exact tame the use is to be enumeneed. Office operators shall also be so notified.
- 3. The packer leakage sen shall commence when both some of the dual completion are shart-in for pressure stabilization. Both somes shall remain shur-in until the well-head pressure at each has stabilized, provided however, that they need not remain shur-in more than seven days.
- 4. For Plow Test No. 1, one zone of the dual complexion shall be produced at the normal rate of production while the other zone remains shart-in. Such sext shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an satural packer leakage text, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Tex No. 1, the well shall again be abor-in, in accordance with Paragraph 3 above.
- Flow Test'No. 2 shall be conducted even though so leak was indicated during Flow.
 Test No. 1. Procedure for Flow Test No. 2 is so be the more as for Flow Test No. 1 encept

- that the previously produced 2000 shall remain short-in while the 2000 which was previously short-in as produced.
- 7. Pressures for gar-sone tests must be measured on each sone with a dendweight pressure gauge at time intervals to follows: 3 hours tests: interediately prior to the beginning of each flow-period, at fifteen-ramous intervals during the first hour thereof, and a hourir intervals thereafter, including one pressure measurement introclinely prior to the conclision of each flow period. 7-day tests: introclinely prior to the beginning of each flow period, at least one time during each flow period (at approximately the midwe point) and introclinely prior to the conclusion of each flow period. Other pressure me to take as desired, or may be requested on wells which have previously shown questionable test data.

34-hour oil some case: all pressures, throughout the entire test, shall be entirement measured and recorded with recording pressure gauges the accounty of which must be checked at least rovice, ease at the beginning and enter at the end of each test, with deadweight pressure gauge. If a well is a gus-oil or an oil-gus dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as require above bring taken on the gus some.

8. The results of the above-described tests shall be filed in triplicate within 13 days afte completion of the test. Tests shall be filed with the Astree District Office of the New Mease Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revise 10-01-78 with all deadweight pressures indicated thereon as well as the flows temperatures (gas aones only) and gravity and GOR (oil somes only).
