NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

I. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completions. Such tests shall also be connected on all multiple completions within seven days

7. Pressures for gas-sone tests must be measured on each zone with a destroyable. following recomplistion and/or changinal or fracture treatment, and whomever remedial work has been done on a well during which the proton or the tabing have been disturbed. Tooks shall also be minn at any time that communication is suspected or when requested by the Division.

2. At least 72 hours prior to the communication of any packer leakage test, the operator shall notify

- the Division in writing of the exact time the test is to be commenced. Offert consister shall also be so notified.
- 3. The protor isaloge test shall economics when both 2000s of the dual completion are shat-in for prossure stabilization. both score shall seemin shut in until the well-hand pressure in each has stabilized, provided however, that they need not recept abut-in most than severa days.

 4. For flow Test No. 1, one some of the dual completion shall be produced at the moment sets of
- production while the other zone sensine shat-in. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an eil well. Note: if, on an initial packer lealings test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall
- 5. Following completion of flow Test No. 1, the well shall again be shat-in, in accordance with
- 6. Flow Test No. 2 shall be conducted even though no look was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour theseof, and at hourly interests thereafter, including one pressure measure immediately prior to the flow period, at least one time during each flow period (at appearimentaly the midway point) and immediately prior to the co notusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionship test data.
- 24-hour oil 2000 tests: all pressures, throughout the entire test, shall be sously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of cach test, with a deadweight pressure gauge. If a well is a gre-oil or an oil-gas shall completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gaz some.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filled with the Axtee District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Pacine Louinge Test form Revised 10/01/78 with all deadweight pressures indicated theseen as well as the flowing temperatures (gas some only) and gravity and GOR (oil zones eniy).
