NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture unaument, and whenever remedial work has been done on a well during which the packer or the rubing have been dururbed. Tests shall also be taken at any time that communication is suffered or when requested by the Division.
- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall multy the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packet leakage test, a gas well is being flowed to the aumosphere due to the lack of a pipeline connection the flow period shall be three hours.
- Following completion of Flow Ten No. 1, the well shall again be shut-in, in accordance with Paragraph 3 shove.
- 6. Fire TerrNo. 2 shall be conducted even though no leak was indicated during Fire the TerrNo. 3 everyte.

- that the previously produced zone shall remain shut-in while the zone which was previly shut-in is produced.
- 7. Pressures for gas-zone term must be measured on each zone with a deadspressure gauge at time intervals as follows: 3 hours term: immediately prior to the be; ing of each flow-period, at fifteen-minute intervals during the furst how thereof, at hourly intervals thereafter, including one pressure measurement immediately prior to conclusion of each flow period, 7-day term immediately prior to the beginning of flow period, at least one time during each flow period (at approximately the milipoint) and immediately prior to the conclusion of each flow period. Other pressure to taken as desired, or may be requested on wells which have previously shown thousable test data.

24-hour oil zone texts: all pressures, throughout the entire text, shall be continued and recorded with recording pressure gauges the accuracy of which muchecked at least rwice, once at the beginning and once at the end of each text, with deadweight pressure gauge. If a well is a gat-oil or an oil-gas dual completion, the reing gauge shall be required on the oil zone only, with deadweight pressure as required to the gat zone.

E. The results of the above-described term shall be filed in triplicate within 15 days completion of the tern. Term shall be filed with the Azter District Office of the New E. Oil Conservation Division on Northwest New Mesico Parket Leakage Tern Form Ec. 10-01-75 with all deadweight pressures indicated thereon as well as the file temperatures (grassiones only) and gravity and GOR (oil zones only).
