Modifications made by Devon Energy at the Middle Mesa CDP include enlargement of piping, installation of larger separation vessels, enlargement of metering facilities, and the installation of slug catchers to facilitate pigging operations in the field. The objective of the modifications was to bring down line and wellhead pressures, which in turn allows the coal formation to give up more gas, increasing production. The new facilities were gradually brought on line and tested, and the entire system was allowed to stabilize as the CDP inlet pressure was incrementally lowered. All components of the new CDP were stabilized and operational by 3/26/99.
