## NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A pacser kakage test shall be commenced on each multiply completed well within several days after actival completion of the well, and annually thereafter as prescribed by the order authorizing the analysis completion. Such tests shall asso be commenced on all multiply ear upleators within several days following recompletion and or chemical or treatment and whenever remedial work has been done on a well during which the packer or the tabing have been distuibled. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2.—At least 12 hears prior to the commercement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The macket leakage test shall commence when both zones of the dual completion are shut-in for pressure standardton. Both zones shall remain shut-in until the well-head pressure it, each has standard provided however, that they need not remain shut-in more than seven days.
- 4. For How Test No. 1, one zone of the dual completion shall be produced at the normal rate of product on while the other zone remains shallon. Such resistable continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an randa packs, leakage test, a gas well is being flowed to the atmosphere due to lack of a pipeline connection the flow period shall be three hours.
- $S=f(\sigma)$  owing completion of blow. Lest  $N\sigma/I$ , the well-shall again be shut-in, in accordance with Baracraph A above
- Face Test No. 2 shall be contacted even though to leas was indicated during Flow Test No. - Procedure for Low Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows. 5 hours tests: immediately prior to the beginning of each flow period, at fifteen-minute intervals as during the first hour thereof; and at hearily intervals thereafter, including one pressure measurement manedately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired or may be requested on wells which have previously shown, instronable toget defin.
- may be requested on wells which have previously shown questionable test data.

  24-hour oil zone tests, all pressures, throughout the intire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.
- 8 The results of the above-described tests shall be filed at triplicate within 15 days after completion of the test. Tests shall be filed with the Azte. District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage. Lest Form Revised 16-61-78 with all deadweight pressures indicated therefor as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
