Well No. 2-1 is located 1180 ft. from {N} line and 1850 ft. from {E} line of sec. 34

NE 1/4 Sec. 34 31N 9W N.M.P.M.
(1/4 Sec. and Sec. No.) (Twp.) (Range) (Meridian)

Blanco Mesa Verde San Juan New Mexico
(Field) (County or Subdivision) (State or Territory)

The elevation of the derrick floor above sea level is 6018 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

It is intended to work this well over in the following manner:

Pull tubing and remove pinhole collars.

Set magnesium bridge plug near bottom of 7" casing and test to 1500#, if no casing leaks are indicated, run magnetic casing survey to further evaluate condition of casing.

Perforate squeeze holes at approximately 2850' (opposite Pictured Cliffs).

Attempt to break circulation to surface in 7" - 9 5/8" annulus. If circulation can be established, cement with 370 sacks with 2% gel in attempt to bring cement to surface.

If circulation cannot be established, squeeze perforations with 75 sacks regular through drillable cement retainer and drop bridging ball.

Then perforate at approximately 1550' and attempt circulation and re-cementing with 200 sacks with 2% gel, or squeeze perforation if circulation cannot be established.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.

with 100 sacks of regular.

If bradenhead flow of gas cut water has not stopped, Bradenhead squeeze with 100 sacks.

Drill out cement, cement retainers and bridge plug, clean out open hole to 5230' with 6 1/4" bit.

Run full string 4 1/2" casing if necessary and attempt to tie cement into bottom of 7" casing.

Perforate and frac Mesa Verde formation, re-run tubing.
