NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage sext shall be commenced on each multiply completed well within seven days after acroal completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all routtiple completions within seven days following recompletion and/or chemical or fracrure measurems, and whenever remedial work has been done on a well during which the packet or the rubing have been distracted. Tests shall also be taken at any time that communication is suspected of when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be enumeraced. Offset operators shall also be so notified.
- The packer leakage test shall cummence when both zones of the dual completion are shart-in for previous stabilization. Both zones shall remain shart-in until the well-head pressure in each has stabilized, provided however, that they need not remain short-in more than seven days.
- 4. For Flow Test No. 1, one some of the dual completion shall be produced at the normal rate of production while the other zone remains short-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 shore.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is to be the same as for Flow Text No. 1 except

- that the previously produced zone shall remain shan-in while the zone which was previously short-in is produced.
- 7. Pressures for gas-zone ress must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests; immediately prior to the beginning of each flow-period, at fairen-missure intervals thereafter, including one pressure measurement interediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil some sexe: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be cherched at least rovier, once at the beginning and once at the end of each sext, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as required above being taken on the gas some.

8. The results of the above-described sests shall be filed in triplicate within 15 days after completion of the rest. Tests shall be filed with the Astee Dutters Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas assess only) and gravity and GOR (oil assess only).
