NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tuting have been disturbed. Tests shall also be taken at any time that reprintication is suspected or when requested by the Division.

 to least 72 to use prior to the commencement of any packer leakage test the morning small result; the Division in writing of the exact time the test of the order of morning.
 freet operators shall also be so notified.

1. To the release reject shall commence when both zones of the dual constitute on a pre-of-or pressure stabilization. Both zones shall rerup shall not to well-meed pressure in each has stabilized, provided and or repeat they need not remain shut-in more than seven days.

the first like in the control of the dual completion shall be produced the control of prediction while the other zone remains shut-in.

The control is continued for seven days in the case of a gas well and the class of an oil well. Note: If, on an initial packer like it is as well is reina flowed to the atmosphere due to the lack in any like convention the flow period shall be three hours.

1. "Lil wird providence of Flow Test No. 1, the well shall again be shutin, or any ridge of buth largeraph 3 above.

of the state of the conducted even though no leak was indicated the state. It friends for Flow Test No. 2 is to be the same of the state of the stat

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3-hour tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges, the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas jual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the Gil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-1-78, with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only). A pressure versus time curve for each zone of each test shall be constructed on the reverse side of the Packer Leakage Test Form with all deadweight pressure points taken indicated thereon. For oil zones, the pressure curve should also indicate all key pressure changes which may be reflected by the recording daye charts. These key pressure changes should also be tabulated on the front of the Packer Leakage Test Form.
