(County or Subdivision)

New Mexico
(State or Territory)

The elevation of the derrick floor above sea level is **6211** ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

It is intended to perforate the casing from 5744' to 5770' with Lane-Wells jet bullets 4 shots per foot; and, to test this section through 2½" tubing. It is also intended to acidize this section with 1,000 gallons Hcl if necessary to secure a proper test.

After testing, the perforations will be squeezed off with cement and the casing perforated high up for completion.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
