OIL CON. COM.
DIST. 3

The elevation of the derrick floor above sea level is 6771 ft.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate sanding jobs, cementing points, and all other important proposed work)

On September 3, 1958, an El Paso Natural Gas Company rotary rig was moved over the hole to begin work-over operations.

Tubing was pulled. A magnesium bridge plug was set at 6375' and holes in the casing were located between 6098' and 6412'. The holes were ignored off and the casing was tested with 1600 psi for 60 minutes. The bridge plug was drilled up and water blown down with gas. The well made approximately 200 MCF/D and a 2" stream of water. Well connections were installed without tubing. The rig was moved off and the well was temporarily abandoned, On October 12, 1958.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
