NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- . A packer leakage test shall be commenced on each multiply completed well within so on cass after actual completion of the well, and annually thereafter as prescribed by the over authorizing the multiple completion. Such tests shall also be commenced on all an imple completions within seven days following recompletion and or chemical or fracture in amount, and whenever concedual work has been done on a well during which the packer of the tubing have been disturbed. Tests shall also be taken at any time that communication is
- so peeted or when requested by the Division

 2. At least 72 hours prior to the commencement of any packer leakage test, the operator
- st. a notify the Division in writing of the exact time the test is to be commenced. Offset of ratios shall also be so notified.

 The marker leakage test shall commence when both zones of the dual commence as
- The macker leakage test shall commence when both zones of the dual completion are slitten for pressure stabilization. Both zones shall remain shirt-in until the well-head possure in each has stabilized, provided however, that they need not remain shur-in more thin seven days.
- 4 For Flow Test No. 1, one zone of the dual completion shall be produced at the normal to a of production while the other zone remains shart-in. Such test shall be continued for so an day in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to lack of a produce connection the flow period shall be three jours.
- 8 . Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance to in Peragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak was indicated during Flow.
 1 (No.) Procedure for Flow Test No. 2 is to rie the same as for Flow Test No. 1 except.

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.
- Pressures for gas-zone tests must be measured on each zone with a deadw right pressure gauge at time intervals as follows. 3 hours tests immediately prior to the beginning of each flow period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests immediately prior to the beginning of each flow speriod at least one time during each flow period at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as district, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously meast-red and recorded with recording pressure gauges the accuracy of which rust be checked at least twice, once at the beginning and once at the end of each test, with a ceadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only with deadweight pressures as required above being taken on the gas zone.
- 8 The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Azrec Dastrict Office of the New Mexico Off Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 19301-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only)
