	R GAS INSPECTOR DIST. #		Title

NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date ..

1. A packer leakage sest shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the rubing have been disturbed. Term shall also be taken at any time that comrespiration is suspected or when requested by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST. #3

Title

LAPSED THE

SINCE **

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the sent is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage sext shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones thall remain shut in until the well-head pressure in each has mabilized, provided however, that they need not remain shot-in more then error days.
- 4. For Flow Text No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains short-in. Such test shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Nove: if, on an initial packer leakage test, a gas well is being flowed to the asmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Text No. 1, the well shall again be short-in, in accordence with Paragraph 3 above.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced 2000 shall remain abus-in while the 2000 which was previously shut-in is produced.
- 7. Pressures for gas-some tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tesu: immediately prior to the beginning of each flow-period, at lifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day series immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and invectisately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

14-hour oil sone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once as the beginning and once at the end of each seat, with a desdweight pressure gauge. If a well is a gus-oil or on oil-gas dual completion, the record-ing gauge shall be required on the oil some only, with desdweight pressures as required above being taken on the gas some.

8. The results of the above-described sens shall be filed in triplicate within 19 days after completion of the text. Texts shall be filed with the Arter Dutter Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas senes only) and gravity and GOR (oil senes only).
