NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage was shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all rauhiple completions within seven days following recompletion and/or chemical or fracture recurrent, and whenever semedial work has been done on a well during which the pocker or the rabing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage sext shall commence when both zones of the dual completion are sharein for pressure stabilization. Both zones shall remain sharein until the well-head pressure in each has stabilized, provided however, that they need not remain sharein more than oven days.
- 4. For Plow Text No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such text shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the asmouphere due to the lack of a pipeline connection the flow period shall be three hours.
-). Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 shore.
- 6. Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced more shall remain shot-in while the more which was previously shot-in is produced.
- 7. Pressures for gas-sone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours term: immediately prior to the beginning of each flow-period, at fafteen-minute intervals during the first hour thereof, and at hously intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, at may be requested on wells which have previously shown questionable test data.

24-hour oil sone text: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least rovice, once at the beginning and once at the end of each text, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil sone only; with deadweight pressures as required above being taken on the gas sone.

8. The results of the above-described sens shall be filed in triplicate within 19 days after completion of the test. Tests shall be filed with the Asset Dutrict Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
