NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

Date

A packer leakage test shall be commenced on each multiply completed well within a days after actual completion of the well, and annually thereafter as prescribed by the r authorizing the multiple completion. Such tests shall also be commenced on all upic completions within seven days following recompletion and/or chemical or fractive tests and whenever remedial work has been done on a well during which the coordinates that the tribing have been disturbed. Tests shall also be taken at any time that commission is suspected or when requested by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST. #3

At least 72 hours prior to the commencement of any packer leakage test, the operator notify the Division in writing of the exact time the test is to be commenced. Offset also be so notified.

The packer leakage test shall commence when both sones of the dual completion are in for pressure stabilization. Both sones shall remain shut-in until the well-head sure in each has stabilized, provided however, that they need not remain shut-in more seven days

For Flow Ten No. 1, one zone of the dual completion shall be produced at the normal of production while the other zone remains shut-in. Such ten shall be continued for n days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on nutal packer leakage ten, a gas well is being flowed to the autosphere due to the lack pipeline connection the flow period shall be three bours.

Following completion of Flow Ten No. 1, the well shall again be shut-in, in accorte with Paragraph 3 above.

Flow Terr'No. 2 shall be conducted even though no leak was indicated during Flow No. 1. Procedure for Flow Ten No. 2 is to be the same as for Flow Ten No. 1 excess that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.

1988

May 18.

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and as hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described term shall be filed in triplicate within 15 days after completion of the test. Term shall be filed with the Azter Dattiet Office of the New Measure Oil Conservation Division on Northwest New Mexico Packer Leakage Ten Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
