NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

A packer leakage test shall be commenced on each multiply completed well within even days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following technipletion and/or chemical or fracture recurrent, and whenever remedial work has been done on a well during which the acceptance of the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

PEPUTY OIL & GAS INSPECTOR

Title

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator mail notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are mut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal are of production while the other zone remains shut-in. Such test shall be continued for teven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5 Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

that the previously produced zone shall remain shut-in while the zone worth was previously shut-in is produced.

DUCTION SPECIALIST

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests; immediately four to the beginning of each flow-period, at futeen-minute intervals during the first four thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests; immediately prior to the segnning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Give pressures may be taken as desired, or may be requested on wells which have prevailly shown questionable test data.

24-hour oil zone testi: all pressures, throughout the entire test. Stall he continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of such test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual comparison, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

R. The results of the above-described tests shall be filed in triplicate minhin 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Form Revised 10-01-78 with all deadweight pressures indicated thereon as with as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
