NASTEMEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. Verious 1 Rado test shall be commenced on each multiply completed fellow in some are after actual completion of the well, and annually test are a completion of the well, and annually test are in a prescribed by the order authorizing the multiple completion. For some shall also be commenced on all multiple completions within some of tellowing recompletion and/or chemical or fracture treatment, the proper reredual work has been done on a well during which the packet for the large more been disturbed. Tests shall also be taken at any time that proper into its stappeted or when requested by the Division.

to the last 71 mains prior to the commencement of any packer leakage test, the agentum small motify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.

The language language test shall commence when both zones of the dual partition are shart in for pressure stabilization. Both zones shall remain shart-in irril the well-head pressure in each has stabilized, provided both

1. In the less two, i. one come of the dual completion shall be produced in the orgal rate of production while the other zone remains shut-in. That the southness of an oil well. Note: If, on an initial packer away, then, a tas well as Found flowed to the atmosphere due to the lack of the line connection the flow period shall be three hours.

3. Following completion of Flow Test No. 1, the well shall again be shutn, to obtain with Euragraph Labove.

of the state of the conducted even though no leak was indicated in the state. In Procedure for Flow Test No. 2 is to be the same of the conduct of the conduct control of the conduct control of the conduct control was previously shuthin is produced.

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 1-hour tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges, the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas Jual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Attec District Office of the Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-1-78, with .11 deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only). A pressure versus time curve for each zone of each test shall be constructed on the reverse side of the Packer Leakage Test Form with all deadweight pressure points taken indicated thereon. For oil zones, the pressure curve should also indicate all key pressure changes which may be reflected by the recording dauge charts. These key pressure changes should also be tabulated on the front of the Packer Leakage Test Form.
