## DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

Total depth 8147' sand and lime. 13-3/8" casing set at 669' cemented to the surface. 9-5/8" casing set at 4410' cemented with 250 sacks (top of cement by temperature survey 3600') This well has been drilled thru the Pennsylvanian and Mississippian formations. Samples, cores, electric logs, and 13 DSTs indicate that none of the formations encountered are commercially productive. We, therefore, desire to plug and abandon the well as follows. Hole will be filled with heavy mud and the following cement, plugs spotted: 35 sacks 8147'-8050'; 30 sacks 7750'-7670'; 30 sacks 7120'-7040'; 65 sacks 6680'-6710'; 85 sacks 4600'-4390'. After parting and pulling all possible 9-5/8" casing 42 sacks from 30' inside the parted pipe to 40' above the parted pipe; 90 sacks 2580'-2460'; 55 sacks 710'-640', and a 4" pipe marker will be cemented in the top of the hole with 35 sacks. All mud and cement plugs will be pumped in thru drill pipe.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
