GAS CAPTURE PLAN

	GAS CAPTURE PLAN				
Date: 05/29/19	RECEIVED				
☑ Original ☐ Amended - Reason for Amendment:	Operator & OGRID No.: Mewbourne Oil Company - 14744				

This Gas Capture Plan outlines actions to be taken by the Operator to reduce well/production facility flaring/venting for new completion (new drill, recomplete to new zone, re-frac) activity.

Note: Form C-129 must be submitted and approved prior to exceeding 60 days allowed by Rule (Subsection A of 19.15.18.12 NMAC).

Well(s)/Production Facility - Name of facility

The well(s) that will be located at the production facility are shown in the table below.

Well Name	API	Well Location (ULSTR)	Footages	Expected MCF/D	Flared or Vented	Comments
Red Hills West 21 WOAP Fed Com #3H	30-025-42912	A, Sec 21-26S-32E	185 N & 650 W	0	NA	Online after frac

Gathering	System	and	Pipcline	No	tification

Well(e) will be	connected to a produ	ction facility after flowback ope	erations are	complete	if age transpo	eter exetem ic in
place. The ga	s produced from pro-	duction facility is dedicated to	Western		and will	be connected to
Western	low/high press	ure gathering system located i	n	County,	New Mexico.	It will require
		e facility to low/high pressure g				
(periodically) to	Western	a drilling, completion and estim-	ated first pro	duction d	ate for wells tha	it are scheduled to
be drilled in th	e foreseeable future.	In addition, Mewbourne Oil C	ompany and	d Wester	rn	have periodic
conference call	s to discuss changes	to drilling and completion sch	edules. Ga	is from t	hese wells will	be processed at
Western	Processin	ng Plant located in Sec. 36, Blk	. 58 T1S	Culbers	on County, Texa	s. The actual flow
of the gas will b	e based on compression	n operating parameters and gatheri	ng system pr	ressures.		

Flowback Strategy

After the fracture treatment/completion operations, well(s) will be produced to temporary production tanks and gas will be flared or vented. During flowback, the fluids and sand content will be monitored. When the produced fluids contain minimal sand, the wells will be turned to production facilities. Gas sales should start as soon as the wells start flowing through the production facilities, unless there are operational issues on <u>Gas-Tanasporter</u> system at that time. Based on current information, it is <u>Operator's</u> belief the system can take this gas upon completion of the well(s).

Safety requirements during cleanout operations from the use of underbalanced air cleanout systems may necessitate that sand and non-pipeline quality gas be vented and/or flared rather than sold on a temporary basis.

Alternatives to Reduce Flaring

Below are alternatives considered from a conceptual standpoint to reduce the amount of gas flared.

- Power Generation On lease
 - o Only a portion of gas is consumed operating the generator, remainder of gas will be flared
- Compressed Natural Gas On lease
 - o Gas flared would be minimal, but might be uneconomical to operate when gas volume declines
- NGL Removal On lease
 - o Plants are expensive, residue gas is still flared, and uneconomical to operate when gas volume declines
