RE: ESTIMATED SCHEDULE OF COMPLETION OF CLOSURE OF AL-1 AND AL-2 (SOILD WASTE MANAGEMENT UNIT 1) COMPLAINT AND CONSENT AGREEMENT AND FINAL ORDER (DOCKET NO. RCRA-0602009-0936)
WESTERN REFINING SOUTHWEST INC., GALLUP REFINERY
EPA ID # NMD000333211
HWB-WRG-20-010

Dear Mr. Moore:

The New Mexico Environment Department (NMED) has reviewed the *Estimated Schedule of Completion of Closure of AL-1 and AL-2 (Solid Waste Management Unit 1) Complaint and Consent Agreement and Final Order (Docket No. RCRA-06-2009-0936)* (Schedule), dated April 15, 2021, submitted on behalf of Marathon Petroleum Company dba Western Refining Southwest Inc., Gallup Refinery (the Permittee).

Comment 7 of the NMED's *Approval with Modifications Solid Waste Management Unit 1 Revised Investigation Report*, dated January 26, 2021, states, "[t]he Permittee must submit a separate work plan that describes all proposed activities related to removal of the Aeration Lagoons and Evaporation Pond 1 that includes a schedule for implementation of the approved work plan for NMED's review no later than **April 30, 2021**."

The Schedule indicates that the work plan will be submitted in the third quarter of 2021 and that the activities (e.g., installation of the test pits, recovery sumps, and French drains) are necessary to prepare the required work plan. Therefore, NMED hereby approves the proposed submittal date. The work plan must be submitted for NMED's review no later than **September 30, 2021**.

Note that the Permittee submitted the *Response to Approval with Modifications Solid Waste Management Unit 1 Revised Investigation Report*, dated April 30, 2021. However, NMED's January 26, 2021 Approval with Modifications directed the Permittee to address the comments in the required work plan, rather than in a response letter. The response letter was not required. All comments in the NMED's January 26, 2021 Approval with Modifications must be addressed in the work plan required above.

If you have questions regarding this letter, please contact Michiya Suzuki of my staff at 505-690-6930.

Sincerely,

Dave Cobrain
Program Manager
Hazardous Waste Bureau

TABLE

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Response to Disapproval Investigation Work Plan, SWMU No. 1 and No. 14" (March 15, 2021)

New Mexico Environment Department (NMED) Comment	Marathon Petroleum Company (MPC) Response
Comment 1:	**Response 1:**
The response to NMED's *Disapproval* Comment 1, item a states, "[t]he proposed boring/temporary well north of SWMU 1-6 and 1-28 will be completed to define the lateral extent of impacts observed in the groundwater sample collected at SWMU 1-6." According to Figure 6, *Proposed Sample Location*, the referenced soil boring is proposed to be installed at the northern perimeter of Pond EP-1. NMED's *Approval with Modifications Solid Waste Management Unit 1 Revised Investigation Report*, dated January 26, 2021, approved a removal of the Aeration Lagoons and Evaporation Pond 1 altogether and required the Permittee to submit a work plan that describes all activities related to the removal no later than **April 30, 2021**. The proposed boring is no longer relevant because of the upcoming excavation of the Aeration Lagoons and Evaporation Pond 1. Whether or not the proposed boring shown on Figure 6 will be located inside the excavation, the removal likely eliminates the source of the contamination from SWMU 1. Accordingly, the proposed soil boring is not necessary.	Marathon Petroleum Corporation (MPC) acknowledges that the proposed boring in the response to NMED's *Disapproval* will no longer be necessary with the removal of the Aeration Lagoons and Evaporation Pond 1. MPC requested an extension on the Aeration Lagoons and Evaporation Pond 1 work plan pending investigation results of the Solid Waste Management Unit (SWMU) 1 test pit and yield test evaluation. The work plan will be submitted no later than September 1, 2021.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Response to Disapproval Investigation Work Plan, SWMU No. 1 and No. 14" (March 15, 2021)

Comment 2:	**Response 2:**
The response to NMED's *Disapproval* Comment 1, item b states, "[a] new proposed soil boring/temporary well is now located up-gradient, to the southeast of the Old API Separator (see Figure 7 and new Figure 8). This is a very active operations area around the flare, so access is limited, but we believe we can locate a well on the east side of the overhead pipe rack." The current refinery shutdown may have improved accessibility in the vicinity of the Old API Separator. Explain whether the structures associated with the Old API Separator and flare stack can be removed under the current refinery shutdown. If so, propose to remove them before the investigation of SWMU 14 takes place. Regardless, the investigations associated with the Old API Separator must be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed. The Old API Separator is located close to the Aeration Lagoons and the removal potentially affects the current scope of investigation. In a response letter, propose to submit an investigation work plan that solely focuses on the investigation of SWMU 14 after the removal of the Aeration Lagoons and Evaporation Pond 1 is completed. In addition, the Permittee's *Flare KOD Pump Sodium Hydroxide Release Soil Sampling Investigation Work Plan*, dated November 30, 2020, proposes soil sampling in the vicinity of the Old API Separator. Since the area of the investigations overlap one another, these investigations may concurrently be conducted and the results may be combined, as appropriate. However, the investigation reports must be submitted separately for tracking purposes. As a reminder, the NMED's *Approval with Modifications Flare KOD Pump Sodium Hydroxide Release Investigation Work Plan*, dated December 21, 2020, requires a submittal of a response letter no later than **April 30, 2021**. The investigations proposed in the *Flare KOD Pump Sodium Hydroxide Release Soil Sampling Investigation Work Plan* may also be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed, as appropriate.	The refinery is currently idled and has begun investigations in areas that would not normally be accessible while the refinery is in operation. Removal of refinery process equipment has not been addressed as the plant is only indefinitely idled and not permanently shut down. The removal of the Aeration Lagoons and Evaporation Pond 1 is tentatively scheduled to be completed in the first quarters of 2022 and 2023. Rather than deferring the Flare KOD investigation until later in 2023, MPC believes it would be prudent to continue advancing assessment of this area to determine the extent of impacts during the current period of idled refinery operations. In addition, the Flare KOD area is located approximately 80 feet south and upgradient of the Aeration Lagoons. The impacts associated with the Flare KOD are high pH soils which is not a constituent of concern for SWMU 1. The Flare KOD Investigation response letter was submitted April 27, 2021. It is anticipated that the field work will take place during the third quarter of 2021. MPC does not plan to defer the work until the removal of the Aeration Lagoons and Evaporation Pond 1.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Response to Disapproval Investigation Work Plan, SWMU No. 1 and No. 14" (March 15, 2021)

Comment 3:	**Response 3:**
The response to NMED's *Disapproval* Comment 1, item c states, "[d]ue to aboveground tanks and overhead pipe racks, it is not possible to get access with a drilling rig any closer than was achieved during the previous field effort. Based on the limited area of concern, the fact that no concentrations exceed the non-residential soil screening levels and the physical access limitations, we recommend no further assessment specifically for 1,2-dibromoethane." The current refinery shutdown may have improved accessibility in the vicinity of the Old API Separator. The extent of contamination associated with 1,2-dibromoethane must be further investigation and the provision must be included in the work plan required by Comment 2 above.	In the area of the Old API Separator, aboveground tanks and overhead pipe racks are still in place. The current idling period has not improved accessibility in the vicinity of the Old API Separator. MPC understands that when the separate work plan is submitted to NMED focusing on SWMU 14, the extent of contamination associated with 1,2-dibromoethane will be included.
Comment 4:	**Response 4:**
The response to NMED's *Disapproval* Comment 1, item c states, "[s]ome of this [north side of the Old API Separator] area is routinely stands surface water [sic], but an effort will be made to install borings in such a manner as to prevent cross-contamination." The issue associated with surface water may be resolved after the Aeration Lagoons are removed. The investigations associated with the Old API Separator must be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed (see Comment 2 above).	The investigation workplan details that the method of borings will utilize hand auguring to a relatively shallow depth to reduce the potential for cross contamination of SWMU 1. See MPC response for Comment 2 regarding deferral of the investigation.
Comment 5:	**Response 5:**
The response to NMED's *Disapproval* Comment 3 states, "[w]e propose one boring on the south, two along the west, one to the north and two along the east side of the Aeration Basin to the north of the New API Separator, with final locations to be determined based on rig access." The confirmatory soil sampling from the excavation floor and sidewall may substitute for the proposed investigation associated with SWMU 1. Accordingly, the investigation associated with SWMU 1 may no longer be necessary (see Comment 1 above).	MPC acknowledges that the proposed boring in the response to NMED's *Disapproval* will no longer be necessary with the removal of the Aeration Lagoons and Evaporation Pond 1.

HWB-WRG-20-010

Dear Mr. Pierard:

Attached please find the response to comments contained in the New Mexico Environment Department (NMED) Approval with Modifications letter dated January 26, 2021. Marathon Petroleum Company (MPC) submitted a scope of work describing a test pit and yield test investigation at Solid Waste Management Unit (SWMU) 1 to NMED on March 9, 2021. The data collected from this investigation will be used to prepare the SWMU 1 closure work plan, requested in NMED's "Disapproval SWMU-1 Investigation Report" issued August 31, 2020. MPC will submit the closure work plan within 90 days of NMED approval of the SWMU 1 test pit and yield test evaluation summary memorandum.

If you have any questions or comments regarding the information contained herein, please do not hesitate to contact Mr. John Moore at 505-879-7643.

Certification

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

New Mexico Environment Department (NMED) Comment	Marathon Petroleum Company (MPC) Response
Comment 1:	**Response 1:**
In the response to NMED's *Disapproval* Comment 2, the Permittee states, "[e]xcavation will be followed by laboratory confirmation sampling of excavation vertical and horizontal extent." A detailed method for post-excavation confirmation sampling and the anticipated horizontal and vertical extent of excavation for each aeration lagoon and Evaporation Pond 1 must be described in the work plan required by NMED's *Disapproval* Comment 14. In addition, the work plan must include a provision to remove additional soils where contaminant concentrations exceed the applicable screening levels in the confirmation samples and the collection of additional confirmation samples from the areas where additional excavation was conducted. Furthermore, a contingency measure addressing contaminated groundwater below the water table, where applicable, must be developed and included in the work plan. For example, chemical oxidants or biological amendments may be placed on the excavation floors, where groundwater is detected. Amendments may also migrate with groundwater flow and aid in degrading contaminants. Additionally, sheet(s) of impermeable liner (e.g., high density polyethylene (HDPE) liner) may be placed above the excavation floor to eliminate potential seepage of groundwater into the backfill.	The work plan required by NMED's *Disapproval* Comment 14 (work plan) will provide details on the removal of soil and sludges from the aeration lagoons (AL-1 and AL-2) and Evaporation Pond 1. The work plan will provide information on the estimated horizontal and vertical extent of the excavation, describe post-excavation confirmation sample collection and analysis, and include provisions for additional excavation and confirmation sampling in areas where soil constituent concentrations exceed applicable screening levels. The work plan will also develop contingency measures to address impacted groundwater below the water table.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

Comment 2:	**Response 2:**
In the response to NMED's *Disapproval* Comment 3, the Permittee states, "[w]hile equipment blanks were not collected, MPC does not believe the integrity of the samples was compromised." The Permittee must propose to collect equipment blanks at a frequency of ten percent of the samples collected in the future. No revision required.	Comment noted.
Comment 3:	**Response 3:**
In the response to NMED's *Disapproval* Comment 4, the Permittee states, "[a]lthough the mercury soil analyses exceeded the holding times for the EPA Method 7471, this analysis was not proposed in the approved investigation work plan and was requested later to provide additional information on mercury concentrations across the ponds." The Permittee's response does not justify the acceptability of analytical data acquired outside the holding time. The analysis should have been conducted within the holding time. However, the Permittee also states, "[t]he TCLP mercury samples, which were proposed in the approved investigation work plan, were analyzed within the holding time," and "TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the Code of Federal Regulations (CFR) TCLP screening level of 0.2 milligram per liter (mg/L)." The results of the TCLP mercury analysis indicate that the mercury exceedance in the soil samples is not likely. Accordingly, the Permittee is not required to recollect soil samples for mercury analysis. No revision required.	Comment noted.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

Comment 4:	**Response 4:**
In the responses to NMED's *Disapproval* Comments 6 and 10, the Permittee states, "[a]n FID is designed to detect a broader range of compounds such as long-chained hydrocarbons, also known as SVOCs, in addition to the VOCs. Because both AL-1 and AL-2 are aeration lagoons, most of the lighter VOCs had volatilized or degraded during aeration leaving the heavier SVOCs in the sludge and hydrocarbon that infiltrated the underlying clay liner," and "an additional functional FID unit will be kept on-site." However, the FID instrument did not work properly because FID flame did not stay lit. The problem may be caused by high moisture content in the samples and may recur. A combustible gas indicator (e.g., Bacharach TLV Sniffer), while less sensitive at low concentrations, is known to be more effective in screening soils that contain high moisture content. Evaluate an applicability of the use of a combustible gas indicator as a backup soil screening tool for future sampling events in SWMU 1 and provide a discussion in the work plan required by NMED's *Disapproval* Comment 14.	MPC will evaluate using a combustible gas indicator as a backup soil screening tool for future solid waste management unit (SWMU) 1 sampling events. The evaluation will be provided in the work plan.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

Comment 5:	**Response 5:**
In the response to NMED's *Disapproval* Comment 7, the Permittee states, "[b]ased on the berm sampling results shown in Table 7, shallow berm soils can likely be segregated in the field during excavation and composite sampled to determine suitability as backfill." The TPH-DRO concentrations in the samples collected from locations SWMU 1-19 (berm) (2.5 ft), SWMU 1-22 (berm) (2.5 ft), SWMU 1-15 (berm) (2.5 ft), and SWMU 1-16 (berm) (2.5 ft) are recorded as 6,300 mg/kg, 2,100 mg/kg, 20,000 mg/kg, and 32,000 mg/kg, respectively, and exceed the applicable soil screening levels (SSLs) according to Table 7, *SWMU-1 Berm Sample Results.* The berm soils excavated at depths more than 2.5 feet below ground surface (bgs) must not be used as a backfill. However, the berm soils excavated at depths less than 1.5 feet bgs can be segregated and composite samples may be collected to evaluate a suitability for backfill use. Include the provision in the work plan required by NMED's *Disapproval* Comment 14.	MPC will discuss segregating berm soil excavated from depths less than 1.5 feet bgs and collecting composite samples to evaluate berm soil suitability for backfill in the required work plan. The evaluation criteria will be provided in the work plan.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

Comment 6:	**Response 6:**
In the responses to NMED's *Disapproval* Comments 9 and 13, the Permittee states, "[t]his standing water is likely from precipitation, with a possible contribution from shallow groundwater seepage (< 6 ft in depth)," and [p]onded water observed in AL-1 and AL-2 is likely perched water trapped by the clay layer which underlies the ponds and results from precipitation and possible shallow groundwater seepage from the east and south." The water observed in the ponds likely originates from groundwater since wastewater discharge was discontinued in 2013 and the precipitation is minimal at the site; yet water persists in the ponds. The clay liner may have been contaminated with the groundwater beneath the ponds. Similarly, the sludge and hydrocarbons accumulated above the liner may have seeped into the groundwater through the liner. Accordingly, it is appropriate to completely remove the clay liner and excavate soils to a depth below the historic water table for ponds AL-1 and AL-2. Include the provision in the work plan required by NMED's *Disapproval* Comment 14.	Soil will be excavated to an appropriate depth based on confirmation sampling results. A contingency will be added to the work plan to address the scenario of if confirmation sampling indicates that soil below the historical water table is impacted with constituent concentrations exceeding applicable screening levels. In addition, MPC is installing a shallow dewatering system to depress the water table in the area to allow for deeper excavation. Provisions for this additional excavation and sampling will be provided in the work plan.

New Mexico Environment Department to Marathon Petroleum Company Comment Letter "Approval with Modifications, Solid Waste Management Unit 1 Revised Investigation Report" (January 26, 2021)

Comment 7:	**Response 7:**
In the response to NMED's *Disapproval* Comment 14, the Permittee states, "MPC will revise the report to state that a separate work plan will be submitted for future remedial excavation of the SWMU." NMED's *Disapproval* Comment 14 states, "NMED will establish a due date for the work plan upon approval of this Report." NMED hereby issues this Approval with Modifications. The Permittee must submit a separate work plan that describes all proposed activities related to removal of the Aeration Lagoons and Evaporation Pond 1 that includes a schedule for implementation of the approved work plan for NMED's review no later than **April 30, 2021.**	To allow for completion of the SWMU 1 test pit and yield test evaluation, MPC requests to submit the work plan describing removal of Aeration Lagoons 1 and 2 and Evaporation Pond 1 within 90 days of NMED approval of the SWMU 1 test pit and yield test evaluation summary memorandum.

RE: Estimated Schedule of Completion of Closure of AL-1 and AL-2 (Solid Waste Management Unit 1)
Complaint and Consent Agreement and Final Order (Docket No. RCRA-06-2009-0936)
Western Refining Southwest LLC – Marathon Gallup Refinery
EPA ID # NMD000333211

Dear Mr. Pierard:

Based on discussions between representatives of the New Mexico Environment Department (NMED), Hazardous Waste Bureau and Western Refining Southwest LLC (f/ka/ Western Refining Southwest, Inc.), Western Refining Southwest LLC (Western Refining) understands that NMED concurs that Western Refining's completion of the approved selected remedy at the former aeration lagoons (Al-1 and AL-2) and evaporation pond (EP-1), known collectively as Solid Waste Management Unit (SWMU) 1 will satisfy the requirements of Section IV of the Compliance Order, specifically Paragraph 100.A, D and H under the Complaint and Consent Agreement and Final Order entered on August 26, 2009 in the matter referenced above (2009 CAFO), as well as satisfy the requirements of the First Modification to the 2009 CAFO entered on September 1, 2010, specifically Paragraph 100.A and H. In particular, Western Refining understands that NMED concurs with the selected remedy of remedial excavation of SWMU 1 as necessary to remove all contaminated soils to meet risk-based cleanup levels as set forth in Western Refining's SWMU 1 Revised Investigation Report, dated January 5, 2021 (January 5, 2021 Revised Investigation Report) and NMED's January 26, 2021 Approval with Modifications, SWMU 1 Revised Investigation Report (January 26, 2021 Approval with Modifications). Consistently, NMED has requested that Western Refining commit to providing a schedule of milestones to NMED for the excavation activities identified in the January 5, 2021 Revised Investigation Report and January 26, 2021 Approval with Modifications. This letter provides the requested schedule and commitment.

Summary of Work Plan

Western Refining will submit a separate work plan for future remediation excavation and closure of SWMU 1. The work plan will include the following major components:

- Closure Performance Standards

John Moore, P.E.
Environmental Supervisor
Western Refining Southwest LLC
A subsidiary of Marathon Petroleum Corporation
I-40, Exit 39
Jamestown, NM 87347

- Facility Information, Site Conditions, SWMU-1 historical summary including data
- Closure Procedures
- Waste Management Procedures
- Dewatering Procedures
- Closure Sampling and Analysis including Confirmation Sampling
- Closure Operations and Schedule

Planned Schedule for Implementing Remediation and Closure Activities

The table below provides our current, best estimate of the schedule for completing the remedial excavation and closure activities outlined above. It is important to recognize that the scheduled dates provided in the table below are based on Western Refining's current, best estimates; however, in view of the potential for disruptions that might impact the timeline for completing the planned remedial measures, Western Refining reserves the right to revise the schedule. In such event, Western Refining will provide an update to the schedule and an explanation for the change.

SCHEDULE FOR IMPLEMENTING REMEDIAL EXCAVATION MEASURES

Remediation Measure	Scheduled Completion Date	Comment
Submit Revised Investigation Report for SWUM 1 to NMED	Submitted to NMED on January 5, 2021	NMED Approved with Modifications on January 26, 2021
Install test pits and recovery sumps	Second Quarter of 2021	
Install French drains along east and south sides	Third Quarter of 2021	
Submit Final Closure Work Plan	Third Quarter of 2021	
Receive NMED Approval of Final Closure Work Plan	Anticipate Fourth Quarter of 2021	Western Refining understands it will work with NMED to address concerns or requested modifications
Commence field work (AL-1 and AL-2)	First Quarter of 2022	
Commence field work (EP-1)	First Quarter of 2023	
Submit Excavation Completion Report for SWMU 1	Second Quarter of 2023	
Receive NMED Approval of Excavation Completion Report for SWMU 1	Anticipate Third Quarter of 2023	Western Refining understands it will work with NMED to address concerns or requested modifications
Submit Class 3 permit modification & a Long-Term	Fourth Quarter of 2023

RE: APPROVAL WITH MODIFICATIONS
RESPONSE TO DISAPPROVAL INVESTIGATION WORK PLAN SOLID WASTE MANAGEMENT UNIT (SWMU) NO. 1 AERATION BASIN AND SWMU NO. 14 OLD API SEPARATOR
WESTERN REFINING SOUTHWEST INC., GALLUP REFINERY
EPA ID # NMD000333211
HWB-WRG-14-005

Dear Mr. Moore:

The New Mexico Environment Department (NMED) has reviewed the *Response to Disapproval Investigation Work Plan Solid Waste Management Unit (SWMU) No. 1 Aeration Basin and SWMU 14 Old API Separator* (Response), dated November 28, 2018, submitted on behalf of Marathon Petroleum Company dba Western Refining Southwest Inc., Gallup Refinery (the Permittee). NMED hereby issues this Approval with Modifications with the following comments.

Comment 1
The response to NMED's *Disapproval* Comment 1, item a states, "[t]he proposed boring/temporary well north of SMWU 1-6 and 1-28 will be completed to define the lateral

extent of impacts observed in the groundwater sample collected at SWMU 1-6." According to Figure 6, *Proposed Sample Location,* the referenced soil boring is proposed to be installed at the northern perimeter of Pond EP-1. NMED's *Approval with Modifications Solid Waste Management Unit 1 Revised Investigation Report,* dated January 26, 2021, approved a removal of the Aeration Lagoons and Evaporation Pond 1 altogether and required the Permittee to submit a work plan that describes all activities related to the removal no later than **April 30, 2021**. The proposed boring is no longer relevant because of the upcoming excavation of the Aeration Lagoons and Evaporation Pond 1.

Whether or not the proposed boring shown on Figure 6 will be located inside the excavation, the removal likely eliminates the source of the contamination from SWMU 1. Accordingly, the proposed soil boring is not necessary.

Comment 2

The response to NMED's *Disapproval* Comment 1, item b states, "[a] new proposed soil boring/temporary well is now located up-gradient, to the southeast of the Old API Separator (see Figure 7 and new Figure 8). This is a very active operations area around the flare, so access is limited, but we believe we can locate a well on the east side of the overhead pipe rack." The current refinery shutdown may have improved accessibility in the vicinity of the Old API Separator. Explain whether the structures associated with the Old API Separator and flare stack can be removed under the current refinery shutdown. If so, propose to remove them before the investigation of SWMU 14 takes place.

Regardless, the investigations associated with the Old API Separator must be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed. The Old API Separator is located close to the Aeration Lagoons and the removal potentially affects current scope of the investigation. In a response letter, propose to submit an investigation work plan that solely focuses on the investigation of SWMU 14 after the removal of the Aeration Lagoons and Evaporation Pond 1 is completed.

In addition, the Permittee's *Flare KOD Pump Sodium Hydroxide Release Soil Sampling Investigation Work Plan*, dated November 30, 2020, proposes soil sampling in the vicinity of the Old API Separator. Since the area of the investigations overlaps one another, these investigations may concurrently be conducted and the results may be combined, as appropriate. However, the investigation reports must be submitted separately for tracking purposes. As a reminder, the NMED's *Approval with Modifications Flare KOD Pump Sodium Hydroxide Release Investigation Work Plan,* dated December 21, 2020, requires a submittal of a response letter no later than **April 30, 2021**. The investigation activities proposed in the *Flare KOD Pump Sodium Hydroxide Release Soil Sampling Investigation Work Plan* may also be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed, as appropriate.

Comment 3
The response to NMED's *Disapproval* Comment 1, item c states, "[d]ue to aboveground tanks and overhead pipe racks, it is not possible to get access with a drilling rig any closer than was achieved during the previous field effort. Based on the limited area of concern, the fact that no concentrations exceed the non-residential soil screening levels and the physical access limitations, we recommend no further assessment specifically for 1,2-dibromoethane." The current refinery shutdown may have improved accessibility in the vicinity of the Old API Separator. The extent of contamination associated with 1,2-dibromoethane must further be investigated and the provision must be included in the work plan required by Comment 2 above.

Comment 4
The response to NMED's *Disapproval* Comment 1, item c states, "[s]ome of this [north side of the Old API Separator] area is routinely stands surface water [sic], but an effort will be made to install borings in such a manner as to prevent cross-contamination." The issue associated with surface water may be resolved after the Aeration Lagoons are removed. The investigations associated with the Old API Separator must be deferred until the removal of the Aeration Lagoons and Evaporation Pond 1 is completed (see Comment 2 above).

Comment 5
The response to NMED's *Disapproval* Comment 3 states, "[w]e propose one boring on the south, two along the west, one to the north and two along the east side of the Aeration Basin to the north of the New API Separator, with final locations to be determined based on rig access." The confirmatory soil sampling from the excavation floor and sidewall may substitute for the proposed investigation associated with SWMU 1. Accordingly, the investigation associated with SWMU 1 may no longer be necessary (see Comment 1 above).

The Permittee must address the comments in this letter and submit a response letter no later than **June 11, 2021**. The investigation work plan required by Comment 2 must be submitted no later than **December 31, 2022**.

This approval is based on the information presented in the document as it relates to the objectives of the work identified by NMED at the time of review. Approval of this document does not constitute agreement with all information or every statement presented in the document.

If you have questions regarding this Approval with Modifications, please contact Michiya Suzuki of my staff at 505-476-6046.

RE: Solid Waste Management Unit 1 Revised Investigation Report
Marathon Petroleum Company LP, Gallup Refinery
(dba Western Refining Southwest, Inc.)
EPA ID# NMD000333211

Dear Mr. Pierard:

Marathon Petroleum Company LP (dba Western Refining Southwest, Inc.) Gallup Refinery is submitting this Revised Investigation Report for the Solid Waste Management Unit (SWMU) 1. The Investigation Report has been enclosed for your review. If there are any questions, please call John Moore at (505) 879-7643.

Certification

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Sincerely,
Marathon Petroleum Company LP, Gallup Refinery

Released to Imaging: 3/2/2021 2:22:29 PM

New Mexico Environment Department (NMED) Comments:

NMED Comment 1:

In the *Planned Sampling Activities* Section, page 8 of 14, the Permittee states, ”[a]nalysis of samples using field screening with a flame ionization detector (FID), and submission of laboratory samples for analysis of VOCs by Method 8260, SVOCs by Method 8270, metals by Method 6010, mercury by Method 7471, and TCLP analysis for lead, mercury, and benzene [were planned].” SWMU-1 Soil Sampling Investigation Work Plan (Work Plan), dated September 23, 2019, states that laboratory sampling analyses of the sediments consist of total petroleum hydrocarbons (TPH), diesel range organics (DRO), and gasoline range organics (GRO). Similarly, the Executive Summary, page 3 of 14, states that the samples were analyzed for TPH-GRO, DRO and ORO. TPH analysis is not included in the statement. Correct the statement for accuracy in the revised Report.

Marathon Petroleum Company (MPC) Response 1:

The sentence has been modified to read as follows in the revised report. “Analysis of samples using field screening with a flame ionization detector (FID), and submission of laboratory samples for analysis of VOCs by Method 8260, SVOCs by Method 8270, metals by Method 6010, mercury by Method 7471, TPH-GRO, TPH-DRO, TPH – motor oil range organics (ORO), and Toxicity Characteristics Leachate Procedure (TCLP) analysis for lead, mercury, and benzene were planned.”

NMED Comment 2:

In the *Planned Sampling Activities, Deviation from Approved Plan* Section, page 9 of 14, the Permittee states, “[d]espite dewatering with a vac truck throughout the week, [AP-1] and AP-2 pond surfaces remained too unstable to collect samples from some of the planned locations. One sample location from AP-1 and all three sample locations from AP-2 had to be moved closer to shore than previously planned. In addition, due to these safety concerns, the native clay liner samples were taken only to a depth of 6 to 12 inches into the native clay rather than "to the planned 8-foot depth.” According to Tables 2A, 2B, and 2C, the concentrations of organic contaminants exceeded the applicable screening levels at the bottom of all soil borings in the native clay intervals. Since the boring depths were compromised due to the safety concerns, vertical extent of contamination was not evaluated. Consequently, the extent of excavation necessary to remediate soil contamination is

not determined. Although the volume of excavation was estimated (e.g., AL-1 for 2,700 cubic yards), the estimation was not justified in the Report. In the revised Report, propose to resolve the safety concerns and recollect soil samples to delineate vertical extent of contamination or propose to excavate to a depth below the depressed water table for maximum soil removal.

MPC Response 2:

Tables 2A, 2B, and 2C show only exceedances, not every sample result. A better picture of the relatively abrupt decrease with depth of concentrations can be seen from Attachment B Tables 1A, 1B and 1C, where the TPH (GRO/DRO/ORO) results for the pond sediments show a relatively abrupt (several orders of magnitude) decrease in concentration with depth as the clay was encountered. For example, for the lowermost clay sample from all three AL-1 pond sample locations (SWMU 1-8 (5 - 5.5 ft), SWMU 1-9 (5.5 - 6 ft), and SWMU 1-10 (4.5 - 5 ft)) are below both the NMED Industrial Soil Screening Levels (ISSL) and Residential Soil Screening Levels (RSSL) for TPH (GRO/DRO/ORO).

To support MPC's assertion that the extent of contamination in the clay is limited, a new table (Table 8) has been added showing frequency of detection below standards for the underlying clay for AL-1, AL-2 and EP-1. Of the 21 TPH (GRO/DRO/ORO) analyses at the seven sample locations collected from the clay liner in AL-1, which includes the toe samples, 95 percent (%) are below the ISSL and 81 % are below both the ISSL and RSSL (Table 8). In other words, five of seven locations are below both the ISSL and RSSL in AL-1 for TPH (GRO/DRO/ORO) and six of the sample locations are below the ISSL for TPH (GRO/DRO/ORO).

Three sample locations out of the six locations collected from the clay liner in AL-2, are below both ISSL and RSSL for TPH (GRO/DRO/ORO). Another sample location is below the ISSL for TPH (GRO/DRO/ORO). Overall, of the 18 analyses from AL-2, 83 percent are below the ISSL and 72 percent are below both the ISSL and the RSSL for TPH (GRO/DRO/ORO).

Six of the nine sample locations from EP-1 were below both ISSL and RSSL for TPH (GRO/DRO/ORO). Only one location had TPH (GRO/DRO/ORO) analyses above both ISSL and RSSL. Of the 27 analyses for TPH (GRO/DRO/ORO) from samples collected from EP-1, 93 percent were below the ISSL and 85 percent were below both the ISSL and RSSL (Table 8). Overall

91 percent of the 66 TPH (GRO/DRO/ORO) analyses collected from all three ponds were below the ISSL.

These results correlate with the color change observed in the clay. Available FID field data also indicate a correlation with TPH-DRO/ORO analytical data (see MPC Response #7 below). Together, field observations (i.e. color of sediments/clay, consistency (obvious sludge), presence of hydrocarbon odor) and FID screening should provide a practical, working basis for full-scale excavation in the field. Excavation will be followed by laboratory confirmation sampling of excavation vertical and horizontal extent. Additional text will be added to accompany the new Table 8 to support this conclusion.

NMED Comment 3:

In the *Planned Sampling Activities, Deviation from Approved Plan* Section, page 9 of 14, the Permittee states, "[t]he sampling plan specified equipment blank collection at a frequency of 10% of samples collected. These samples were not collected. The hand auger was decontaminated prior to each sample depth by brushing off soil and by cleaning off any sludge until the surface of the hand auger was visibly clean. The hand-auger and spade were decontaminated using Simple Green™ between each sample location." Even if equipment was visibly clean, residual contaminants may have been present. Unless equipment blank is collected and tested, it is impossible to verify that the sampling equipment was clean, and the analytical results were not affected by cross-contamination. Demonstrate that the acquired data is defensible without equipment blank in the revised Report.

MPC Response 3:

While equipment blanks were not collected, MPC does not believe the integrity of the samples was compromised. Several factors were considered in making this determination.

In MPC Response Comment 2, it was shown that 91% of the bottom clay liner analyses from AL-1, AL-2, and EP-1 were below ISSLs for TPH (GRO/DRO/ORO). This indicates that the bottom clay samples were not significantly cross-contaminated by the sludge from the interval immediately above the bottom clay or from potential cross-contamination between sample locations. The remaining 9% of the bottom clay liner analyses were most likely impacted in-situ, not as a result of sampling.

In addition, within each borehole, after collection of the overlying sludge sample, the hand auger had to be pushed through the sloughing black sludge to the bottom clay liner to collect the sample, so that decontamination and the importance of an equipment blank was minimal due to the issue of having to sample the clay through the sludge. To eliminate as much cross-contamination as possible to the clay layer, the outer black sludge was removed from the clay sample, so only clay was placed in the sample jar. In addition, gloves were changed between sludge and clay sample collection. Finally, the augers were decontaminated between boreholes, including washing and rinsing to remove all visible traces of sludge.

This response will be added to the revised report to explain why the lack of equipment blanks does not affect the data quality and interpretation.

NMED Comment 4:

In the *Planned Sampling Activities, Deviation from Approved Plan* Section, page 9 of 14, the Permittee states, "[t]he laboratory had enough remaining sample left to analyze for total mercury, but it was completed outside the holding time of 28 days. Samples of mercury that were reported as not detected are considered unusable due to the length of time between sampling and analysis." The Laboratory Analytical Results, (QA/QC Samples Section[)], page 13 of 14, states that the laboratory determined that the precision, accuracy, validity, and usability of the data were not compromised; however, a justification for the usability of analytical data acquired outside the holding time is not discussed in the Report. Whether or not mercury is detected, all mercury concentrations analyzed outside the holding time are not usable for risk evaluation. In the revised Report, propose to recollect soil samples for mercury analysis or propose to excavate to a depth below the historic water table for maximum soil removal (e.g., more than ten feet bgs) to address potential risk associated with mercury.

MPC Response 4:

The TCLP mercury samples, which were proposed in the approved investigation work plan, were analyzed within the holding time. Although the mercury soil analyses exceeded the holding times for the EPA Method 7471, this analysis was not proposed in the approved investigation work plan and was requested later to provide additional information on mercury concentrations across the

ponds. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the Code of Federal Regulations (CFR) TCLP screening level of 0.2 milligram per liter (mg/L). The revised report will be modified to include text to support this conclusion.

NMED Comment 5:

In the *Field investigation Results* Section, page 10 of 14, the Permittee states, "[p]ond sample depths ranged from surface collection to 6.5 ft below ground surface (bgs)." According to Table 1, none of the pond soil samples were collected at a depth of 6.5 feet bgs. Correct the statement for accuracy in the revised Report.

MPC Response 5:

According to Table 1, sample location SWMU 1-19 (toe) (6-6.5 ft) was sampled to a depth of 6.5 feet below the pond surface. Though designated toe samples, toe samples are effectively pond samples because they exhibit the same silty, sandy surface layer underlain by three to five feet of sludge, which lies above the native clay liner. The report text will be revised to reflect that the toe sample lithology is similar to pond sample lithology.

NMED Comment 6:

In the *Field investigation Results, Summary of Field Sampling Activities* Section, page 10 of 14, the Permittee states, "[h]eadspace sampling of the samples was conducted using an FID. Only samples collected on Monday, January 13, 2020 were sampled with the FID, as the FID and its replacement would not operate properly; specifically, the flame would not stay lit." It is not clear why only flame ionization detector (FID) was used during the investigation. Photo ionization detector (PID) was also proposed in the Work Plan (page 9) and could have been used as well. Explain why a PID was not used during the investigation in the revised Report.

MPC Response 6:

The sludge in the aeration lagoons has been accumulating since the refinery was built. These sludges consist of heavily weathered hydrocarbon products. A PID is designed to detect light volatile organic compounds (VOC) such as benzene, toluene, ethylbenzene, and xylene compounds. Additionally, a PID does not work well with pond sediments due to the moisture content of the

sediments. An FID is designed to detect a broader range of compounds such as long-chained hydrocarbons, also known as SVOCs, in addition to the VOCs. Because both AL-1 and AL-2 are aeration lagoons, most of the lighter VOCs had volatilized or degraded during aeration leaving the heavier SVOCs in the sludge and hydrocarbon that infiltrated the underlying clay liner. Based on the above, an FID was selected for screening the soils and sludges as it would be able to detect the heavier hydrocarbons, as well as the lighter hydrocarbons.

NMED Comment 7:

In the *Laboratory Analytical Results*, *VOCs* Section, page 12 of 14, the Permittee states, "[e]xceedances were observed in DRO, GRO, and Oil Range Organics (ORO) across the pond and lagoons." The concentrations of organic contaminants exceeded the applicable screening levels in all berm samples. Soils outside of the berms are potentially contaminated due to the activities associated with SWMU 1. In the revised Report, propose to submit a work plan to advance soil borings outside the berms to investigate the lateral extent of potential soil contamination or commit to expanding the remedial excavation as necessary to remove all contaminated soils to meet risk-based cleanup levels. The investigation is necessary to determine lateral extent of excavation unless all affected soils are removed.

MPC Response 7:

Soils outside of the berms were not sampled, as this was not proposed as part of the approved work plan. Other, earlier, samples outside of the bermed areas were collected, as shown on Figure 2. These results showed that only one sample (SWMU 1-1 (2-4 ft), of the 17 soil borings advanced along the berm of all three ponds, exceeded ISSL and RSSL. This boring was located near the discharge lines coming from the new American Petroleum Institute separator (Western Refining 2013). All wastewater flow was discontinued by June 2013 when the flow was diverted to the new wastewater treatment plant (Western Refining 2013). Therefore, additional seepage into the berm would not be expected since mid-2013.

Based on the berm sampling results shown in Table 7, shallow berm soils can likely be segregated in the field during excavation and composite sampled to determine suitability as backfill. Deeper berm soils and soils outside of the berms can be assessed during excavation on the basis of physical

appearance, odor, and FID field screening, segregated if necessary, and sampled. A statement will be added to the final report.

NMED Comment 8:

In the *Laboratory Analytical Results, Metals* Section, page 12 of 14, the Permittee states, "[e]xceedances were observed for arsenic, antimony, and mercury compared to the USEPA RSSL and the NMED Residential SSL." Since the mercury analysis was conducted outside the holding time, the discussion regarding the detection of mercury must be qualified in the Report. Revise the Report accordingly.

MPC Response 8:

As in MPC Response 4 above, although the mercury analyses exceeded the holding times for the EPA Method 7471, this analysis was not included in the approved investigation work plan, thus not required. The TCLP mercury results, which were included in the approved investigation work plan, were analyzed within the holding time. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the CFR TCLP screening level of 0.2 mg/L. Therefore, additional sampling, other than confirmation samples collected after excavation, will not be necessary. The revised report will be modified to include text to support this conclusion.

NMED Comment 9:

In the *Laboratory Analytical Results, General Chemistry* Section, page 12 of 14, the Permittee states, "[f]ree liquids were analyzed and resulted in a positive or negative result [paint filter test). Of the 97 sample locations only six resulted in a positive paint filter test resulting in the sample having free liquid." All sampling locations were too shallow. Excavation will likely be necessary below the water table. If soils are excavated below the water table, the results of the paint filter test may be different. No response required.

MPC Response 9:

The standing water observed in AL-1 and AL-2 is likely perched within the pond clay liners and is not representative of the deeper water table. This standing water is likely from precipitation, with a possible contribution from shallow groundwater seepage (< 6 ft in depth). Test pits proposed for

areas adjacent to AL-1 and AL-2 will assist in determining the potential for significant seepage which could affect waste excavation. The deeper groundwater may be present at lower depths in EP-1. For example, the depth to water in local monitoring wells GWM-1 (northwest corner of EP-1) in 2016 (2016 Annual Report) was approximately 22 ft below grade, GWM-2 and GMW-3 were dry (total depths approximately 18 and 19 ft below grade, respectively).

NMED Comment 10:

In the *Laboratory Analytical Results, Correlation of Analytical Results with FlD Field Screening* Section, page 13 of 14, the Permittee states, "[t]he FlD will be used during excavation to confirm that hydrocarbon contaminated soil has been excavated from the lagoons and pond along with visual indicators and laboratory confirmation sampling." Since FID failed during this investigation, PID or other appropriate instrument must be proposed for future investigations in SWMU 1. Revise the Report accordingly.

MPC Response 10:

The piece of equipment delivered onsite failed but the information that the FID provided while operational showed a clear correlation between contamination and elevated FID readings. Higher DRO results generally corresponded with higher FID readings. The revised report will include language stating that in future investigations, an additional functional FID unit will be kept on-site.

NMED Comment 11:

In the *Conclusion* Section, page 13 of 14, the Permittee states, "[t]his investigation was conducted to characterize soils and sediments in EP-1, AL-1, and AL-2 for future excavation and closure of SWMU-1." The investigation failed to characterize lateral and vertical extent of contamination necessary for the planned excavation (see Comments 2 and 7). Clarify that the investigation did not achieve the intended purpose in the revised Report.

MPC Response 11:

As noted in MPC Responses to Comments 2 and 7, much of the vertical and horizontal delineation of contamination was achieved. Therefore, clarification that the investigation did not achieve the intended purpose is not necessary. Text will be added that the results to provide a firm basis for

proceeding with an excavation plan, which will include the field screening to aid in contamination delineation and laboratory confirmation sampling.

NMED Comment 12:

In the *Conclusion* Section, page 13 of 14, the Permittee states, “volumes for excavation and disposal [are estimated] for EP-1 (non-hazardous] 11,500 yd^3, AL-1 1,700 yds^3 (listed hazardous) and AL-2 3,800 yds^3 (listed hazardous).” According to the Executive Summary, page 4 of 14, the estimated volumes for excavation for EP-1, AL-1, and AL-2 are listed as 11,500, 2,700, and 4,500 cubic yards (yds^3), respectively. There is a discrepancy in the estimated volumes. Regardless, the estimated volume of excavation will increase once the extent of soil contamination is delineated appropriately. Revise the Report accordingly.

MPC Response 12:

The volume provided in the executive summary are correct. The report volumes will be changed.

NMED Comment 13:

In the *Conclusion* Section, page 13 of 14, the Permittee states, "[g]enerally, the oily sludge in the ponds had a specific gravity of 1.92, and a pH of 8.66. Of the 106 samples of sludge, only 6 had free liquids in the sample. This shows that the water accumulating in the ponds is like from outside SWMU 1 and not coming from groundwater.” Sludge is defined as a mixture of solids and liquids. All sludge samples should contain liquids. Provide a clarification in the revised Report. In addition, discuss the origin of the water accumulated in the ponds in the revised Report.

MPC Response 13:

The revised report will include the following text for clarification, “While it is true that all sludge samples have high moisture content, it does not necessarily mean that all sludge contains *free* liquids. Much of the liquid within the sludge may have been trapped within the sludge at the time of its deposition and is potentially emulsified with petroleum into a gel-like consistency based on field observations by the field geologist.”

Ponded water observed in AL-1 and AL-2 is likely perched water trapped by the clay layer which underlies the ponds and results from precipitation and possible shallow groundwater seepage from the east and south. Based on the shallow water table elevations NAPIS well and in the Seeps area to the south, it is seepage into the ponds may be occurring along the eastern and southern edge of AL-1 and AL-2.

NMED Comment 14:

In the *Conclusion* Section, page 14 of 14, the Permittee states, "[f]ollowing NMED's review of these results and approval of the characterization of SWMU 1, MPC plans to proceed with the remedy implementation for the excavation and closure of the SWMU." A separate work plan is required for future remedial excavation. NMED will establish a due date for the work plan upon approval of this Report. Revise the Report accordingly.

MPC Response 14:

MPC will revise the report to state that a separate work plan will be submitted for future remedial excavation of the SWMU.

Executive Summary

The Marathon Petroleum Company, Gallup Refining Division (MPC) is submitting this revised investigation report for sampling of soils and sediments at the former aeration lagoons (AL-1 and AL-2) and evaporation pond (EP-1), known collectively as Solid Waste Management Unit (SWMU) 1. The sampling was conducted for the purposes of soil and sediment volume determination and chemical characterization for future SWMU 1 excavation, disposal, and closure. The sampling took place the week of January 13, 2020 and was conducted in accordance with an approved work plan submitted to the New Mexico Environment Department (NMED) on September 23, 2019 (MPC 2019) and approved with modifications by NMED on October 30, 2019.

SWMU 1 was part of a former aggressive biological treatment unit where refinery wastewater flowed through the aeration lagoons in series and into the evaporation pond. Based on this usage and the concurrence of the NMED Hazardous Waste Bureau (NMED 2019), AL-1 and AL-2 sediments are classified as F-listed (F037/F038) hazardous waste, with EP-1 soils/sediment potentially classified as non-hazardous pending the results of this investigation.

Field work consisted of:

- Collection of samples at four location in EP-1 and at three locations in AL-1 and AL-2.
- Collection of samples on each of the four berms of the lagoons and the pond.
- Measuring soil/sediment thickness at all sampling locations.

The samples were collected using a hand auger and analyzed for pH, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, toxic characteristics leaching procedure (TCLP) (benzene, lead, and mercury), total petroleum hydrocarbons TPH for gasoline range organics (GRO), diesel range organics (DRO) and oil range organics (ORO). The results were compared with NMED Industrial Soil Screening Levels (ISSL) June 2019, TCLP Screening Levels (40 CFR 261.24) and United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) Industrial Soil Hazard Quotient 0.1. Analytes exceeding the NMED SSLs and/or the EPA RSLs were:

- TPH (GRO, DRO, and ORO).
- SVOCs (1-methylnaphthalene, 2-methylnapthalene, naphthalene, benzo(a)anthracene, and benzo(a)pyrene).
- metals (arsenic and mercury).

TCLP results for lead, mercury and benzene were below TCLP standards.

Based on field observations during sample collection, a material type and color change (black waste sludge to gray native clay) is associated with a decrease in contaminant concentrations, which should assist with determining the vertical extent of excavation. Field flame ionization detector (FID) sample headspace data are also positively correlated with laboratory analytical data. Volumes for excavation were calculated using the average depth of contamination and the pond areas, and then rounded to the nearest 100 yds^3, with resulting volumes as follows:

- AL-1: Average depth 5.2 ft, surface area 13,789 square feet (ft^2), volume 2,700 cubic yards (yds^3).
- AL-2: Average depth 5.3 ft, surface area 23,211 ft^2, volume 4,500 yds^3.
- EP-1: Average depth 5.3 ft, surface area 58,757 ft^2, volume 11,500 yds^3.

Introduction

The Marathon Petroleum Company, Gallup Refining Division (MPC) is submitting this revised investigation report for sampling of soils and sediments at the former aeration lagoons (AL-1 and AL-2) and evaporation pond (EP-1), known collectively as Solid Waste Management Unit (SWMU) 1. The sampling was conducted for the purposes of soil and sediment volume determination and chemical characterization for future SWMU 1 excavation, disposal, and closure. The sampling took place the week of January 13, 2020 and was conducted in accordance with an approved work plan submitted to the New Mexico Environment Department (NMED) on September 23, 2019 (MPC 2019). The work plan was approved by NMED on October 30, 2019.

Prior sampling was conducted in 2008 (Trihydro 2008) when the ponds were flooded and a boat was required. The resulting sediment depths and waste volumes were affected by the presence of water. The current effort was conducted while the ponds were substantially dry, and includes specific chemical analyses, such as the Toxicity Characteristics Leaching Procedure (TCLP), not analyzed for in the prior SWMU 1 investigation.

Background

MPC, Gallup Refining Division (Refinery) is located approximately 17 miles east of Gallup, McKinley County, New Mexico along the north side of Interstate Highway I-40 (Figure 1). The physical address is I-40, Exit #39 Jamestown, New Mexico 87347. The Refinery property covers approximately 810 acres.

The Refinery is a crude oil refinery that processes crude oil transported by pipeline or tanker truck from the Four Corners region. Various process units operated at the Refinery include: crude distillation, reformer, fluidized catalytic cracker, alkylation, sulfur recovery, merox treater, and hydrotreater. Current and past operations have produced gasoline, diesel fuels, jet fuels, kerosene, propane, butane, and residual fuel.

SWMU 1 consists of the former aeration lagoons (AL-1 and AL-2) and the evaporation pond (EP-1) (Figure 1), which were constructed in 1987. Operation ceased in 2013. AL-1 and AL-2 are approximately 0.3 acres and 0.5 acres, respectively, and EP-1 is approximately 1.3 acres. The Refinery's process wastewater treatment train consisted of an American Petroleum Institute separator, benzene air strippers, and an aggressive biological treatment unit (ABTU) consisting of the two aeration lagoons in series, followed by evaporation in EP-1. AL-1, AL-2, and EP-1 are earthen surface impoundments with native clay functioning as a bottom liner (DiSorbo 2018).

Based on their usage as a component of an ABTU, AL-1 and AL-2 sediments have been classified as listed hazardous waste (F037/F038), whereas sediments in EP-1 by definition would not be classified as a listed hazardous waste, but may be hazardous depending on sampling and analysis results (NMED 2019).

Historic Sampling and Results

Prior sampling of the sediments and laboratory analysis were conducted in 2008 of AL-1, AL-2, and EP-1 (Trihydro 2008). Sampling was conducted using a boat because of the presence of water in the ponds. Laboratory sampling analyses of the sediments consisted of total petroleum hydrocarbons (TPH), diesel range organics (DRO), and gasoline range organics (GRO) by United States Environmental Protection Agency (USEPA) method 8015, semi-volatile organic

compounds (SVOCs) by USEPA method 8270, volatile organic compounds (VOCs) by USEPA Method 8260, Resource Conservation and Recovery Act (RCRA) metals by USEPA Method 6010C, and mercury by USEPA Method 7471.

In the 2008 report (Trihydro 2008), standards for comparison consisted of NMED Industrial Soil Screening Levels (ISSLs) and the USEPA Maximum Concentrations of Contaminants for the Toxicity Characteristic (CFR Title 40 Part 261). The Toxicity Characteristics Leaching Procedure (TCLP) analysis was not performed. In the absence of TCLP analyses, the sample concentrations were divided by 20 and compared to the TCLP standard as the maximum theoretical leachate concentration that could be observed from the sample. This was to evaluate the potential for soils from the sample to exceed the TCLP standard and was used as a screening tool.

Twenty-six samples, using the EPA-approved RCRA calculation for comparing total metals concentrations to the TCLP standard, from various sediment depths in the three areas exceeded the Toxicity Characteristic for mercury, and three samples from AL-1 exceeded the Toxicity Characteristic for lead. During this sampling, approximate sediment thickness and volumes were estimated as follows:

- AL-1: 3.5 feet (ft) to 6.0 ft, 1,700 cubic yards (yds^3).
- AL-2: 6.5 ft to 9.6 ft, 3,800 yds^3.
- EP-1: 1.2 ft to 5.1 ft, 3,200 yds^3.

Historical sample locations are shown on Figure 2.

Planned Sampling Activities

A Soil Sampling Investigation Work Plan (MPC 2019) was submitted and approved by the NMED in September 2019 (NMED 2019), and consisted of the following major elements:

- Samples collected using a hand-auger in locations predetermined by the RCRA Post-Closure Permit guidelines.
- Three sampling locations in each of the two aeration ponds and four sampling loctions in the evaporation pond to a depth of 8 ft or refusal.
- Pond berm sampling at locations along each of the pond berms (four berms/pond), starting at the top and then at an interval of 2.5 vertical ft and a depth of 1.5 ft in as near a horizontal direction as possible.
- Analysis of samples using field screening with a flame ionization detector (FID), and submission of laboratory samples for analysis of VOCs by Method 8260, SVOCs by Method 8270, metals by Method 6010, mercury by Method 7471, TPH-GRO, TPH-DRO, TPH - motor oil range (ORO), and TCLP analysis for lead, mercury, and benzene were planned. Free liquids, pH, and specific gravity were also analyzed by the laboratory.

- Duplicate samples for the purpose of quality assurance.
- Analytical results comparison against NMED ISSLs, TCLP and the NMED Residential Soil Screening Levels (RSSLs). The hazardous waste determination was completed using the TCLP standards compared against the benzene, mercury, and lead results.

Deviations from Approved Plan

Deviations from the sampling plan approved by NMED (NMED 2019) included the following:

1. Samples were to be collected at the surface and every 2.5 ft to a maximum depth of 8 ft; however, during the sampling it became apparent that immediately below the surface sediment was a homogeneous black sludge that varied in thickness above a visually distinct native clay liner. Attachment A provides the field notes from the sampling event. It was decided that only a surface, one sludge, and one native clay sample would be collected from each location in the basins.

2. Despite dewatering with a vac truck throughout the week, AL-1 and AL-2 pond surfaces remained too unstable to collect samples from some of the planned locations. One sample location from AL-1 and all three sample locations from AL-2 had to be moved closer to shore than previously planned. In addition, due to these safety concerns, the native clay liner samples were taken only to a depth of 6 to 12 inches into the native clay rather than to the planned 8-foot depth. Sample locations and depths are shown on Figure 2 and summarized in Table 1.

3. While equipment blanks were not collected, MPC does not believe the integrity of the samples was compromised. Several factors were considered in making this determination.

   In MPC Response Comment 2, it was shown that 91% of the bottom clay liner analyses from AL-1, AL-2, and EP-1 were below ISSLs for TPH (GRO/DRO/ORO). This indicates that the bottom clay samples were not significantly cross-contaminated by the sludge from the interval immediately above the bottom clay or from potential cross-contamination between sample locations. The remaining 9% of the bottom clay liner analyses were most likely impacted in-situ, not as a result of sampling.

   In addition, within each borehole, after collection of the overlying sludge sample, the hand auger had to be pushed through the sloughing black sludge to the bottom clay liner to collect the sample, so that decontamination and the importance of an equipment blank was minimal due to the issue with having to sampling the clay through the sludge. To eliminate as much cross-contamination as possible to the clay layer, the outer black sludge was removed from the clay sample, so only clay was placed in the sample jar. In addition, gloves were changed between sludge and clay sample collection. Finally, the augers were decontaminated between boreholes, including washing and rinsing to remove all visible traces of sludge.

4. The planned sampling activities included field screening with an FID. The FID received from the rental agency would not stay lit after the first day of use and a replacement was ordered. The replacement FID would not function. Due to repeated technical issues with the FIDs, only samples from the first day (approximately 20) were able to be screened in the field. While all field data were not screened, there was sufficient FID data to establish a positive correlation between the FID results and the laboratory VOC and SVOC data.

5. TCLP benzene analyses were performed on those samples where benzene soil concentrations exceeded 0.5 mg/kg, rather than all samples. This was a screen recommended by the laboratory Hall Environmental to optimize the number of benzene TCLP analyses.

6. The TCLP mercury samples, which were proposed in the approved investigation work plan, were analyzed within the holding time. Although the mercury soil analyses exceeded the holding times for the EPA Method 7471, this analysis was not proposed in the approved investigation work plan and was requested later to provide additional information on mercury concentrations across the ponds. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the Code of Federal Regulations (CFR) TCLP screening level of 0.2 milligrams per liter (mg/L).

7. A Tier I data validation was completed on all the samples. Tier II data validation will be completed on the confirmation results following excavation of SWMU 1. The Tier I validation reviewed potential problems with the data and did not identify possible biases or errors in the lab data. The data were considered accurate for the purposes of excavation delineation and waste disposal determination.

8. A comparison of the analytical results to Land Disposal Restrictions (LDRs) is not submitted in this report; but following selection of the waste treatment/disposal firms MPC will complete the LDR form and comparison.

Field Investigation Results

Trihydro conducted the sampling January 13-17, 2020. The samples were collected from 22 locations, including 10 pond sediment and 12 berm locations. Pond or toe sample depths ranged from surface collection to 6.5 ft below ground surface (bgs). Though designated toe samples, toe samples are effectively pond samples because they exhibit the same silty, sandy surface layer underlain by three to five feet of sludge, which lies above the native clay liner. Berm locations were taken from the inside of the pond to a vertical depth of 9 ft through the top of berm. The samples were generally collected in the locations presented in the Soil Sampling Investigation Work Plan (MPC 2019) but deviated slightly based on the conditions observed in the pond and lagoons during the sampling, as discussed above.

Summary of Field Sampling Activities

A total of 97 samples plus 10 duplicate samples and 5 trip blanks were collected from the three ponds. A summary of samples and locations are shown on Figure 2 and in Table 1.

Sampling began on the top and sidewall berms of the three ponds while AL-1 and AL-2 fluid was being removed with a vac truck. Several samples were identified as toe and berm samples. The toe samples were collected starting with sediment taken from the base of the berm, including any surface soil, another sample was taken of any sludge, and lastly a native clay sample was taken from below the sludge. Although these samples are classified as toe samples, they are, in fact, pond samples due to the presence of several feet of sludge. Surface samples on the pond and lagoons were taken with a spade and placed in a Ziplock bag. The hand auger was then advanced down through the sludge to the hard-packed native clay liner to determine the depth to the top of the native clay liner. The sludge sample was extracted from the hand auger as it came out of the hole and placed in a Ziplock bag. Dry decontamination of the auger by brushing and scraping was conducted between depths. Then the hand auger was used to obtain a sample of the native clay liner. Generally, penetration into the native clay was limited to approximately 1 foot because of difficulty turning

the auger in the native clay. The field geologist visually observed the samples and recorded the observations in the field notebook. The hand auger and spade were decontaminated using Simple Green™ between each sample location.

Headspace sampling of the samples was conducted using an FID. Only samples collected on Monday, January 13, 2020 were sampled with the FID, as the FID and its replacement would not operate properly; specifically, the flame would not stay lit. The piece of equipment delivered onsite failed but the information that the FID provided while operational showed a clear correlation between contamination and elevated FID readings. Higher DRO results generally corresponded with higher FID readings. In future investigations, an additional functional FID unit will be kept on-site.

The sludge in the aeration lagoons has been accumulating since the refinery was built. These sludges consist of heavily weathered hydrocarbon products. A PID is designed to detect light volatile organic compounds (VOC) such as benzene, toluene, ethylbenzene, and xylene compounds. Additionally, a PID does not work well with pond sediments due to the moisture content of the sediments. An FID is designed to detect a broader range of compounds such as long-chained hydrocarbons, also known as SVOCs, in addition to the VOCs. Because both AL-1 and AL-2 are aeration lagoons, most of the lighter VOCs had volatilized or degraded during aeration leaving the heavier SVOCs in the sludge and hydrocarbon that infiltrated the underlying clay liner. Based on the above, an FID was selected for screening the soils and sludges as it would be able to detect the heavier hydrocarbons, as well as the lighter hydrocarbons.

The samples were placed in laboratory provided sample containers, labeled, and placed in a cooler, iced, and delivered to Hall Environmental Laboratories for analysis for VOCs by USEPA Test Method 8260B; SVOCs by USEPA Test Method 8270C; TPH by USEPA Test Method 8015M; total metals by USEPA Test Methods 6010B and 7471; benzene TCLP by USEPA Test Method 8260B; mercury and lead TCLP by USEPA Test Methods 7470 and 1311/6010A, pH, specific gravity, and free liquids (paint filter).

Field Observations of Pond Conditions

EP-1

The toe of each EP-1 berm had 6 to 12 inches of surface sediment, underlain by up to 3 ft of black sludge overlying a native clay layer. The native clay layer in the toe samples showed little to no visual evidence of staining, and the transition in color and texture from black sludge to native unstained clay was obvious. Samples in EP-1 were taken in locations as indicated in the workplan. The samples taken within the pond had minimal surface sediment with 3 to 5 ft of sludge overlying the native clay layer. Surface water was observed on approximately a quarter of the pond area. Groundwater was not encountered during the sampling.

AL-1

AL-1 conditions required sample SWMU 1-8 to be collected closer to the shoreline than the work plan proposed due to safety concerns as shown on Figure 2. Samples were collected using a pallet as a sampling platform. Samples consisted of 3 to 6 inches of surface sediment underlain by 4 to 6 ft of sludge overlying a native clay layer. As with EP-1, the transition from black sludge to unstained native clay was obvious. The maximum sample depth was dictated by the native clay layer. Samples were generally taken up to 6 to 12 inches into the native clay layer, after which it was deemed unsafe to continue due to the unstable sampling platform. Surface water was observed on approximately a third of the pond area, prior to vac truck removal, which reduced the surface water coverage to approximately 25% of the area. Groundwater was not encountered during the sampling.

AL-2

Conditions in AL-2 were similar to AL-1, but with more saturated conditions. AL-2 conditions required all sampling to be collected closer to the shoreline than the workplan indicated due to safety concerns (Figure 2). Samples consisted of 0 to 6 inches of surface sediment underlain by 4 to 5.5 ft of sludge overlying a native clay layer. As in AL-1, the maximum sample depth was dictated by an unstained native clay layer, which was readily discernible . Samples were taken 6 to 12 inches into a native clay layer, after which it was deemed unsafe to continue. Surface water was observed on approximately a third of the pond area prior to vac truck removal, which reduced the surface water coverage to approximately 25% of the area. Groundwater was not encountered during the sampling.

Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples were recorded on the field forms.

Laboratory Analytical Results

Analytical results for exceeded detections of the various parameters are presented in the following tables:

- Table 2 – VOCs
- Table 3 – SVOCs
- Table 4 – Metals

Results are organized in these tables by pond. Tables with all the sampling results compared to the soil standards are included in Attachment B. Analytical laboratory reports are included in Attachment C. The ranges of detected concentrations of analytes are summarized in the sections below. An interpretation of the results, including a comparison to the standards, is also presented below. The sample locations are shown on Figure 2 and summarized in Table 1.

VOCs

The detected exceedance sample results of VOCs are provided in Tables 2a through 2c. A complete summary of all sample results is included in Attachment B. Exceedances were observed in DRO, GRO, and Oil Range Organics (ORO) across the pond and lagoons. The NMED ISSL for DRO and ORO are both 3,000 milligrams per kilogram (mg/kg) and 500 mg/kg for GRO. The NMED RSSL for DRO and ORO are both 1,000 mg/kg and 100 mg/kg for GRO. The detections were generally higher in locations sampled closer to the surface, and as shown in Appendix B Tables 1A, 1B and 1C, the concentrations relatively abruptly (several orders of magnitude) decrease with depth as the clay is encountered.. No other VOC detections exceeded the standards.

Benzene samples with concentrations greater than 0.5 mg/kg were analyzed for TCLP benzene. Only 8 samples from AL-1 met this criterion. No detections of benzene exceeded the NMED SSL's of 87.24 mg/kg for an Industrial Worker. No detections of benzene TCLP exceeded the 40 CFR 261.24 TCLP Screening Level of 0.5 mg/kg.

SVOCs

The detected exceedance sample results of SVOCs are provided in Tables 3a through 3c. 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene exceeded their respective NMED RSSLs and the USEPA RSL's, but these analytes

did not exceed the NMED ISSL. Benzo(a)anthracene and benzo(a)pyrene exceeded all three of the standards in one location, SWMU 1-9 in the surface sample. Benzo(a)pyrene exceeded the NMED RSSL and USEPA RSL for SWMU 1-9 at 4.5 ft. No other exceedances were observed.

Metals

The detected exceedance sample results of metals are provided in Tables 4a through 4c. Exceedances were observed for arsenic, antimony, and mercury compared to the USEPA RSL and the NMED RSSL. Arsenic did not exceed the NMED ISSL and a standard for mercury has not been established for NMED. Antimony exceeded the NMED RSSL in two locations, SWMU 1-20 (toe) (0.5 – 3 ft) and SWMU 1-11 (toe). Lead did not exceed any of the applicable screening levels. The TCLP results for mercury and lead did not exceed the screening levels from 40 CFR 261.24.

Although the mercury analyses exceeded the holding times for the EPA Method 7471, this analysis was not included in the approved investigation work plan, thus not required. The TCLP mercury results, which were included in the approved investigation work plan, were analyzed within the holding time. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the CFR TCLP screening level of 0.2 mg/L. Therefore, additional sampling, other than confirmation samples collected after excavation, will not be necessary.

General Chemistry

Sample results of general chemistry analyses, pH, free liquids, and specific gravity are provided in Table 5. The pH ranged from 3.48 in SWMU 1-19 (toe) to 9.13 in SWMU 1-22 ((toe) (3.5-4 ft)) with an average pH for all the samples of 7.52. Specific gravity ranged from 1.03 g/cm^3 in SWMU 1-12 (toe) to 2.21 g/cm^3 in SWMU 1-17 ((berm) (1.5 ft)). Free liquids were analyzed and resulted in a positive or negative result (paint filter test). Of the 97 sample locations only six resulted in a positive paint filter test resulting in the sample having free liquid. Those locations are: SWMU 1-10 (4-4.5 ft), SWMU 1-18 (toe), SWMU 1-18 (toe) (2.5 ft), SWMU 1-20 (toe) (0.5-3 ft), SWMU 1-8 (2.5 ft), and SWMU 1-9 (4.5 ft). A summary of the free liquid detected during sampling is shown on Figure 3.

The standing water observed in AL-1 and AL-2 is likely perched within the pond clay liners and is not representative of the deeper water table. This standing water is likely from precipitation, with a possible contribution from shallow groundwater seepage (< 6 ft in depth). Test pits proposed for areas adjacent to AL-1 and AL-2 will assist in determining the potential for significant seepage which could affect waste excavation. The deeper groundwater may be present at lower depths in EP-1. For example, the depth to water in local monitoring wells GWM-1 (northwest corner of EP-1) in 2016 (2016 Annual Report) was approximately 22 ft below grade, GWM-2 and GMW-3 were dry (total depths approximately 18 and 19 ft below grade, respectively).

Pond Berm Analytic Results Summary

Soils outside of the berms were not sampled, as this was not proposed as part of the approved work plan. Other, earlier, samples outside of the bermed areas were collected, as shown on Figure 2. These results showed that only one sample (SWMU 1-1 (2-4 ft), of the 17 soil borings advanced along the berm of all three ponds, exceeded ISSL and RSSL. This boring was located near the discharge lines coming from the new American Petroleum Institute separator (Western Refining 2013). All wastewater flow was discontinued by June 2013 when the flow was diverted to the new wastewater

treatment plant (Western Refining 2013). Therefore, additional seepage into the berm would not be expected since mid-2013.

Based on the berm sampling results shown in Table 7, shallow berm soils can likely be segregated in the field during excavation and composite sampled to determine suitability as backfill. Deeper berm soils and soils outside of the berms can be assessed during excavation on the basis of physical appearance, odor, and FID field screening, segregated if necessary, and sampled.

Pond Clay Liner Analytic Results Summary

A distinct clay liner was encountered in this investigation. This liner was evidenced by its material properties (hand-augering in clay) and unstained color. A better picture of the relatively abrupt decrease with depth of concentrations can be seen from Attachment B Tables 1A, 1B and 1C, where the TPH (GRO/DRO/ORO) results for the pond sediments show a relatively abrupt (several orders of magnitude) decrease in concentration with depth in a boring location as the clay was encountered. For example, in Attachment B Table 1A, the TPH (GRO/DRO/ORO) results for the lowermost clay sample from all three AL-1 pond sample locations (SWMU 1-8 (5 - 5.5 ft), SWMU 1-9 (5.5 - 6 ft), and SWMU 1-10 (4.5 – 5 ft)) are below both the NMED Industrial Soil Screening Levels (ISSL) and Residential Soil Screening Levels (RSSL) for TPH (GRO/DRO/ORO).

To support MPC's assertion that the extent of contamination in the clay is limited, Table 8 presents the frequency of detection above standards for the underlying clay for AL-1, AL-2 and EP-1. Tables 2A, 2B, and 2C show only exceedances, not every sample result.

Of the 21 TPH (GRO/DRO/ORO) analyses at the seven sample locations collected from the clay liner in AL-1, which includes the toe samples, 95 percent are below the ISSL and 81 percent are below both the ISSL and RSSL (Table 8). That is five of seven locations are below both the ISSL and RSSL in AL-1 for TPH (GRO/DRO/ORO). Six of the sample locations are below the ISSL for TPH (GRO/DRO/ORO).

Three sample locations out of the six locations collected from the clay liner in AL-2, are below both ISSL and RSSL for TPH (GRO/DRO/ORO). Another sample location is below the ISSL for TPH (GRO/DRO/ORO). Overall, of the 18 analyses from AL-2, 83 percent are below the ISSL and 72 percent are below both the ISSL and the RSSL for TPH (GRO/DRO/ORO).

Six of the nine sample locations from EP-1 were below both ISSL and RSSL for TPH (GRO/DRO/ORO). Only one location had TPH (GRO/DRO/ORO) analyses above both ISSL and RSSL. Of the 27 analyses for TPH (GRO/DRO/ORO) from samples collected from EP-1, 93 percent were below the ISSL and 85 percent were below both the ISSL and RSSL (Table 8). Overall 91 percent of the 66 TPH (GRO/DRO/ORO) analyses collected from all three ponds were below the ISSL.

These results correlate with the color change observed in the clay. Available FID field data also indicate a correlation with TPH-DRO/ORO analytical data (see below). Together, field observations and FID screening should provide a practical, working basis for full-scale excavation in the field. Excavation will be followed by laboratory confirmation sampling of excavation vertical and horizontal extent.

QA/QC Samples

Five methanol blank samples were provided by the laboratory as trip blanks. These samples were sent in the coolers by the laboratory and were not altered between sampling and analysis. Methylene chloride, 1-methylnaphthalene, 2-methylnaphthalene, 1,2,4-trimethylbenzene, 4-methyl-2-pentanone, and toluene were detected in the blank samples. Methylene chloride is a common laboratory contaminant and was detected in all of the laboratory blanks and several of the soil samples. None of the detected blank samples exceeded the standards.

Tier I data validation was performed on the data package provided by the laboratory. The Tier I data validation included a review of the completeness of the data packages, COC's, sample condition receipts, sample preservations, holding times, the case narrative, and the quality control summary. Several notations were provided in the quality control summary provided by the laboratory, but the laboratory determined that the precision, accuracy, validity, and usability of the data were not compromised, and that corrective actions were not necessary. Following a review of the Tier I data validation parameters, it was determined that the data set was generally complete.

Correlation of Analytical Results with FID Field Screening

FID results from the first day were compared to the TPH results from the samples they were analyzed from. The comparison is provided in Table 6. Results with high detections of DRO (greater than 200 mg/kg) had an FID reading greater than 1.5 ions per second. These results indicate a potential positive correlation between the analytical results and soil characteristics in the field. The FID will be used during excavation to confirm that hydrocarbon contaminated soil has been excavated from the lagoons and pond along with visual indicators and laboratory confirmation sampling.

Conclusions

This investigation was conducted to characterize soils and sediments in EP-1, AL-1, and AL-2 for future excavation and closure of SWMU-1. Much of the vertical and horizontal delineation of contamination was achieved. The results provide a firm basis for proceeding with an excavation plan, which will include the field and laboratory sampling procedures. Significant findings include:

- Confirmation that EP-1 soil/sediments are not RCRA hazardous based on the toxicity criteria.
- Estimated volumes for excavation and disposal for EP-1 (non-hazardous) 11,500 yd^3, AL-1 2,700 yds^3 (listed hazardous) and AL-2 4,500 yds^3 (listed hazardous).
- Characterization of the berm soil for potential re-use for excavation backfill.
- Pond sediment as consisting of a thick oily sludge, whose composition was confirmed by elevated TPH results.
- Generally, the oily sludge in the ponds had a specific gravity of 1.92, and a pH of 8.66. Of the 106 samples of sludge, only 6 had free liquids in the sample. This shows that the water accumulating in the ponds is likely from outside SWMU 1 and not coming from groundwater. While it is true that all sludge samples should contain liquids, it does not necessarily mean that all sludge contains *free* liquids. Much of the liquid within the sludge was trapped within the sludge at the time of its deposition and appears to be emulsified with petroleum into a gel-like consistency.

Ponded water observed in AL-1 and AL-2 is likely perched water trapped by the clay layer which underlies the ponds. Based on the shallow water table elevations in the Seeps area to the south, it is also possible that seepage into the ponds is occurring along the southern edge of AL-1 and AL-2.

- Based on the analytical data and field observations, the waste excavation of the ponds can be reliably guided by visual observation of the sludge/native clay liner interface, color change of the native clay to a natural grey color, and FID sampling. Confirmation sampling will be conducted following excavation completion including mercury analysis.

Following NMED's review of these results and approval of the characterization of SWMU 1, MPC plans to submit and investigation work plan that is required by NMED before the remedial excavation and closure of the SWMU is implemented. MPC plans to engage with a contractor for the excavation and disposal of the ponds. Once the contractor is identified and Waste Acceptance Criteria, including LDRs, are identified based on the contractor's proposed method of treatment and disposal, an excavation sampling plan will be submitted to the NMED for review and approval.

Closure sampling will be completed to confirm that the contaminated soil has been removed and submitted to NMED for review prior to backfill. Similar to this report, following the approval of the closure sampling MPC anticipates the submittal of a Class 3 RCRA permit modification for their Final RCRA Post-Closure Permit.

USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019

AL - Aeration Lagoon

ft - feet

mg/kg - milligrams per kilogram

NA - Not Applicable, samples did not exceed the standards

SWMU - Solid Waste Management Unit

Dup - Duplicate Sample

(toe) samples composited in the field

(berm) samples taken along the berm

Samples taken in Aeration Lagoon 1.

Samples without location depths were taken from the surface.

Sediment Sampling Field Form

Project Name:	Gallup Refinery SWMU 1 Pond Sampling	Sample Media:	Sediment
Sample ID:	SWMU 1-1	Sample Date:	1/16/2020
Location:	EP-1 North Berm	Sample Time Berm Surface:	845
Samplers:	PH/BM	Sample Time Berm 0.5' - 3.0':	849
Weather:	Sunny, cool	Sample Time Berm 5.0':	950

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	2.5'
Sample Depth Top Sludge:	0.5-2.5'		

Sample Description:

Berm Sediment:

Top	0'	Black to black-brown clayey sandy silt, slight HC odor, dry, loose
Side	0.5' - 3.0'	Black sludge
Side	5.0'	chocolate brown plastic clay, dense, moist, HC staining and odor

Comments:

Sediment Sampling Field Form

Project Name:	Gallup Refinery SWMU 1 Pond Sampling	Sample Media:	Sediment
Sample ID:	SWMU 1-2	Sample Date:	1/14/2020
Location:	EP-1 North Berm	Sample Time Berm Surface:	825
Samplers:	PH/BM	Sample Time Berm 0.5' - 2.9':	829
Weather:	Sunny, cool	Sample Time Berm 3.0' - 3.5':	829

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	3' - 3.5'
Sample Depth Top Sludge:	2.0-2.5'		

Sample Description:

Berm Sediment:

Top	0'	Black to black-brown clayey sandy silt, slight HC odor, dry, loose, DUP 9
Side	0.5' - 2.9'	sludge, very wet, plstic, soft, HC odor strong
Side	3.0' - 3.5'	Pink/brown clay, plastic, moist, dense, hard

Comments:

Sediment Sampling Field Form

Project Name:	Gallup Refinery SWMU 1 Pond Sampling	Sample Media:	Sediment
Sample ID:	SWMU 1-3	Sample Date:	1/14/2020
Location:	EP-1 North Berm	Sample Time Berm 0.0':	1650
Samplers:	PH/BM	Sample Time Berm 3.0':	1705
Weather:	Sunny, cool	Sample Time Toe 0.5' - 3.0':	1654

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	2.5'
Sample Depth Top Sludge:	0.5-2.5'		

Sample Description:

Berm Sediment:

Top	0.0' - 0.5'	black moist plastic soft clay, wet, HC odor and staining
Side	3.0' - 3.5'	black and brown plastic clay with silt, HC staining and odor

Toe Sediment: 0.5' - 3.0' Black sludge

Comments:

Sediment Sampling Field Form

Sample ID:	SWMU 1-5	Sample Date:	1/17/2020
Location:	EP-1 North Berm	Sample Time Berm Surface:	835
Samplers:	PH/BM	Sample Time Berm 0.5' - 5.0':	840
Weather:	Sunny, cool	Sample Time Berm 5.5' - 6.0':	845

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	2.5'
Sample Depth Top Sludge:	2.5' - 5.0'		

Sample Description:

Berm Sediment:

Top	0'	Black clayey silt, slightly plastic, moist, HC odor and staining
Side	0.5' - 5.0'	Black sludge, very wet, strong HC odor
Side	5.5' - 6.0'	black moist clay with silt, HC odor and staining

Comments:

Sediment Sampling Field Form

Project Name:	Gallup Refinery SWMU 1 Pond Sampling	Sample Media:	Sediment
Sample ID:	SWMU 1-6	Sample Date:	1/17/2020
Location:	EP-1 North Berm	Sample Time Berm Surface:	-
Samplers:	PH/BM	Sample Time Berm 0.5' - 5.0':	900
Weather:	Sunny, cool	Sample Time Berm 5.5' - 6.0':	925

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	2.5'
Sample Depth Top Sludge:	0.5-2.5'		

Sample Description:

Berm Sediment:

Top	0'	no surface sample
Side	0.5' - 5.0'	Sludge. Black, wet, strong HC odor clayey sludge
Side	5.5' - 6.0'	Black silty clay, plastic, moist, HC staining and odor

Comments:

Berm Sediment:		
Top	1.5'	brown dry clayey sand with silt, uF-F, DUP 1
Side	2.5'	Black-brown clay with silt, some gravel, moist, HC odor
Toe Sediment:	0.0'	Black-brown clayey silt, HC odor, moist, crumbly with small plastic balls, DUP 6
	2.5'	Black runny sludge, Heavy odor
	4.0' - 4.5'	Black-gray clay plastic, medium soft
	5.0'	Black hard clay with silt, irridesence blue on surfaces, HC odor and staining, almost looks like ash

Comments:

Sediment Sampling Field Form

Project Name:	Gallup Refinery SWMU 1 Pond Sampling	Sample Media:	Sediment
Sample ID:	SWMU 1-17	Sample Date:	1/13/2020
Location:	EP-1 North Berm	Sample Time Berm Surface:	1555
Samplers:	PH/BM	Sample Time Berm 2.5':	1604
Weather:	Sunny, cool		
		Sample Time Toe 0.0':	1338
		Sample Time Toe 4.5' - 5.0':	1350

Sample Description

Sampling Equipment:	Auger, sediment sampler		
Sample Depth Surface:	0.0-0.5'	Sample Depth Top Clay:	2.5'
Sample Depth Top Sludge:	0.5-2.5'		

Sample Description:

Berm Sediment:		
Top	0'	dry dark brown silty sand with gravel, vF-m , no odor
Side	2.5'	moist plastic clay, red-brown with trace gravel, no odor
Toe Sediment:	0'	dark brown to black silty plastic clay, HC staining and odor
	2.5'	Sludge, very wet, soft, black, HC odor
	4.5' -5.0'	chocolate brown clay, moist, plastic, trace silt, some black HC staining mostly on outside of samples, some black staining at top of interval

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
TCLP SL - Toxicity Characteristic Levels from 40 CFR 261.24.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
TCLP - toxicity characteristic leaching procedure
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Benzene was analyzed for TCLP if the initial sample was detected above 0.5 ug/kg.
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
TCLP SL - Toxicity Characteristic Levels from 40 CFR 261.24.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
TCLP - toxicity characteristic leaching procedure
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Benzene was analyzed for TCLP if the initial sample was detected above 0.5 ug/kg.
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
TCLP SL - Toxicity Characteristic Levels from 40 CFR 261.24.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
TCLP - toxicity characteristic leaching procedure
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Benzene was analyzed for TCLP if the initial sample was detected above 0.5 ug/kg.
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
TCLP SL - Toxicity Characteristic Levels from 40 CFR 261.24.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
TCLP - toxicity characteristic leaching procedure
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Benzene was analyzed for TCLP if the initial sample was detected above 0.5 ug/kg.
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.

NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Aeration Lagoon 2.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of samples.

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of sample.

Notes:
NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of sample.

USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of sample.

USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of sample.

ATTACHMENT B - TABLE 1C. SWMU 1 SAMPLING - VOLATILE ORGANIC COMPOUNDS (EP-1)
MARATHON PETROLEUM COMPANY, GALLUP, NEW MEXICO

Location ID	Date Sampled	tert-Butylbenzene (mg/kg)	Tetrachloroethene (mg/kg)	Toluene (mg/kg)	trans-1,2-Dichloroethene (mg/kg)	trans-1,3-Dichloropropene (mg/kg)	Trichloroethene (mg/kg)	Trichlorofluoromethane (mg/kg)	Vinyl Chloride (mg/kg)

NMED SSL's - New Mexico Environmental Department Industrial and Residential Soil Screening Levels, June 2019
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment samplings logs for lithology of samples.

NMED SSL's - New Mexico Environmental Department Industrial Soil Screening Levels, June 2019
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment samplings logs for lithology of samples.

NMED SSL's - New Mexico Environmental Department Industrial Soil Screening Levels, June 2019
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
EP - Evaporation Pond
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Evaporation Pond 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment samplings logs for lithology of samples.

NMED SSL's - New Mexico Environmental Department Industrial Soil Screening Levels, June 2019
TCLP SL - Toxicity Characteristic Levels from 40 CFR 261.24.
USEPA RSL Industrial Soil HQ 0.1 - United States Environmental Protection Agency, Regional Screening Levels, Hazard Quotient 0.1, November 2019
AL - Aeration Lagoon
TCLP - toxicity characteristic leaching procedure
ft - feet mg/kg - milligrams per kilogram
NA - Not Applicable ND - Not Detected (Reporting Limit)
SWMU - Solid Waste Management Unit
Dup - Duplicate Sample
(toe) samples composited in the field (berm) samples taken along the berm
Samples taken in Aeration Lagoon 1.
Samples without location depths were taken from the surface.
Bolded values exceed the standard.
See sediment sampling logs for lithology of samples.

RE: Gallup SWMUI Sampling Event OrderNo.: 2001623

Dear Paul Hildebrandt:

Hall Environmental Analysis Laboratory received 24 sample(s) on 1/16/2020 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

Andy Freeman
Laboratory Manager
4901 Hawkins NE
Albuquerque, NM 87109

ANALYTICAL REPORT

January 27, 2020

Hall Environmental Analysis Laboratory

Sample Delivery Group: L1180718

Samples Received: 01/17/2020

Project Number:

Description:

Report To:

4901 Hawkins NE

Albuquerque, NM 87109

Entire Report Reviewed By: Daphne R Richards

Daphne Richards
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Daphne R Richards

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
	The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

RE: Gallup SWMUI Sampling Event OrderNo.: 2001723

Dear Paul Hildebrandt:

Hall Environmental Analysis Laboratory received 28 sample(s) on 1/17/2020 for the analyses presented in the following report.

This report is a revised report and it replaces the original report issued January 31, 2020.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. All samples are reported as received unless otherwise indicated.

Please don't hesitate to contact HEAL for any additional information or clarifications.

Sincerely,

Andy Freeman

Laboratory Manager

4901 Hawkins NE
Albuquerque, NM 87109

ANALYTICAL REPORT

January 28, 2020

Hall Environmental Analysis Laboratory

Sample Delivery Group: L1181371

Samples Received: 01/21/2020

Project Number:

Description:

Report To:

4901 Hawkins NE

Albuquerque, NM 87109

Entire Report Reviewed By: Daphne R Richards

Daphne Richards
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description

ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Our Locations

Pace National has sixty-four client support centers that provide sample pickup and/or the delivery of sampling supplies. If you would like assistance from one of our support offices, please contact our main office. Pace National performs all testing at our central laboratory.

Qualifiers:

*	Value exceeds Maximum Contaminant Level.
D	Sample Diluted Due to Matrix
H	Holding times for preparation or analysis exceeded
ND	Not Detected at the Reporting Limit
PQL	Practical Quanitative Limit
S	% Recovery outside of range due to dilution or matrix
B	Analyte detected in the associated Method Blank
E	Value above quantitation range
J	Analyte detected below quantitation limits
P	Sample pH Not In Range
RL	Reporting Limit

RE: Gallup SWMUI Sampling Event OrderNo.: 2001739

Dear Paul Hildebrandt:

Hall Environmental Analysis Laboratory received 60 sample(s) on 1/18/2020 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

Andy Freeman
Laboratory Manager

Daphne Richards
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
	The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

ACCREDITATIONS & LOCATIONS

ONE LAB. NATIONWIDE.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Our Locations

Pace National has sixty-four client support centers that provide sample pickup and/or the delivery of sampling supplies. If you would like assistance from one of our support offices, please contact our main office. Pace National performs all testing at our central laboratory.

Title: Environmental Superintendent

Executive Summary

The Marathon Petroleum Company, Gallup Refining Division (MPC) is submitting this revised investigation report for sampling of soils and sediments at the former aeration lagoons (AL-1 and AL-2) and evaporation pond (EP-1), known collectively as Solid Waste Management Unit (SWMU) 1. The sampling was conducted for the purposes of soil and sediment volume determination and chemical characterization for future SWMU 1 excavation, disposal, and closure. The sampling took place the week of January 13, 2020 and was conducted in accordance with an approved work plan submitted to the New Mexico Environment Department (NMED) on September 23, 2019 (MPC 2019) and approved with modifications by NMED on October 30, 2019.

SWMU 1 was part of a former aggressive biological treatment unit where refinery wastewater flowed through the aeration lagoons in series and into the evaporation pond. Based on this usage and the concurrence of the NMED Hazardous Waste Bureau (NMED 2019), AL-1 and AL-2 sediments are classified as F-listed (F037/F038) hazardous waste, with EP-1 soils/sediment potentially classified as non-hazardous pending the results of this investigation.

Field work consisted of:

- Collection of samples at four location in EP-1 and at three locations in AL-1 and AL-2.
- Collection of samples on each of the four berms of the lagoons and the pond.
- Measuring soil/sediment thickness at all sampling locations.

The samples were collected using a hand auger and analyzed for pH, volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), metals, toxic characteristics leaching procedure (TCLP) (benzene, lead, and mercury), total petroleum hydrocarbons TPH for gasoline range organics (GRO), diesel range organics (DRO) and oil range organics (ORO). The results were compared with NMED Industrial Soil Screening Levels (ISSL) June 2019, TCLP Screening Levels (40 CFR 261.24) and United States Environmental Protection Agency (EPA) Regional Screening Levels (RSL) Industrial Soil Hazard Quotient 0.1. Analytes exceeding the NMED SSLs and/or the EPA RSLs were:

- TPH (GRO, DRO, and ORO).
- SVOCs (1-methylnaphthalene, 2-methylnapthalene, naphthalene, benzo(a)anthracene, and benzo(a)pyrene).
- metals (arsenic and mercury).

TCLP results for lead, mercury and benzene were below TCLP standards.

Based on field observations during sample collection, a material type and color change (black waste sludge ~~sludge~~ to gray native clay) is associated with a decrease in contaminant concentrations, which should assist with determining the vertical extent of excavation. Field flame ionization detector (FID) sample headspace data are also positively correlated with laboratory analytical data. Volumes for excavation were calculated using the average depth of contamination and the pond areas, and then rounded to the nearest 100 yds^3, with resulting volumes as follows:

- AL-1: Average depth 5.2 ft, surface area 13,789 square feet (ft^2), volume 2,700 cubic yards (yds^3).
- AL-2: Average depth 5.3 ft, surface area 23,211 ft^2, volume 4,500 yds^3.
- EP-1: Average depth 5.3 ft, surface area 58,757 ft^2, volume 11,500 yds^3.

Introduction

The Marathon Petroleum Company, Gallup Refining Division (MPC) is submitting this revised investigation report for sampling of soils and sediments at the former aeration lagoons (AL-1 and AL-2) and evaporation pond (EP-1), known collectively as Solid Waste Management Unit (SWMU) 1. The sampling was conducted for the purposes of soil and sediment volume determination and chemical characterization for future SWMU 1 excavation, disposal, and closure. The sampling took place the week of January 13, 2020 and was conducted in accordance with an approved work plan submitted to the New Mexico Environment Department (NMED) on September 23, 2019 (MPC 2019). The work plan was approved by NMED on October 30, 2019.

Prior sampling was conducted in 2008 (Trihydro 2008) when the ponds were flooded and a boat was required. The resulting sediment depths and waste volumes were affected by the presence of water. The current effort was conducted while the ponds were substantially dry, and includes specific chemical analyses, such as the Toxicity Characteristics Leaching Procedure (TCLP), not analyzed for in the prior SWMU 1 investigation.

Background

MPC, Gallup Refining Division (Refinery) is located approximately 17 miles east of Gallup, McKinley County, New Mexico along the north side of Interstate Highway I-40 (Figure 1). The physical address is I-40, Exit #39 Jamestown, New Mexico 87347. The Refinery property covers approximately 810 acres.

The Refinery is a crude oil refinery that processes crude oil transported by pipeline or tanker truck from the Four Corners region. Various process units operated at the Refinery include: crude distillation, reformer, fluidized catalytic cracker, alkylation, sulfur recovery, merox treater, and hydrotreater. Current and past operations have produced gasoline, diesel fuels, jet fuels, kerosene, propane, butane, and residual fuel.

SWMU 1 consists of the former aeration lagoons (AL-1 and AL-2) and the evaporation pond (EP-1) (Figure 1), which were constructed in 1987. Operation ceased in 2013. AL-1 and AL-2 are approximately 0.3 acres and 0.5 acres, respectively, and EP-1 is approximately 1.3 acres. The Refinery's process wastewater treatment train consisted of an American Petroleum Institute separator, benzene air strippers, and an aggressive biological treatment unit (ABTU) consisting of the two aeration lagoons in series, followed by evaporation in EP-1. AL-1, AL-2, and EP-1 are earthen surface impoundments with native clay functioning as a bottom liner (DiSorbo 2018).

Based on their usage as a component of an ABTU, AL-1 and AL-2 sediments have been classified as listed hazardous waste (F037/F038), whereas sediments in EP-1 by definition would not be classified as a listed hazardous waste, but may be hazardous depending on sampling and analysis results (NMED 2019).

Historic Sampling and Results

Prior sampling of the sediments and laboratory analysis were conducted in 2008 of AL-1, AL-2, and EP-1 (Trihydro 2008). Sampling was conducted using a boat because of the presence of water in the ponds. Laboratory sampling analyses of the sediments consisted of total petroleum hydrocarbons (TPH), diesel range organics (DRO), and gasoline range organics (GRO) by United States Environmental Protection Agency (USEPA) method 8015, semi-volatile organic

compounds (SVOCs) by USEPA method 8270, volatile organic compounds (VOCs) by USEPA Method 8260, Resource Conservation and Recovery Act (RCRA) metals by USEPA Method 6010C, and mercury by USEPA Method 7471.

In the 2008 report (Trihydro 2008), standards for comparison consisted of NMED Industrial Soil Screening Levels (ISSLs) and the USEPA Maximum Concentrations of Contaminants for the Toxicity Characteristic (CFR Title 40 Part 261). The Toxicity Characteristics Leaching Procedure (TCLP) analysis was not performed. In the absence of TCLP analyses, the sample concentrations were divided by 20 and compared to the TCLP standard as the maximum theoretical leachate concentration that could be observed from the sample. This was to evaluate the potential for soils from the sample to exceed the TCLP standard and was used as a screening tool.

Twenty-six samples, using the EPA-approved RCRA calculation for comparing total metals concentrations to the TCLP standard, from various sediment depths in the three areas exceeded the Toxicity Characteristic for mercury, and three samples from AL-1 exceeded the Toxicity Characteristic for lead. During this sampling, approximate sediment thickness and volumes were estimated as follows:

- AL-1: 3.5 feet (ft) to 6.0 ft, 1,700 cubic yards (yds^3).
- AL-2: 6.5 ft to 9.6 ft, 3,800 yds^3.
- EP-1: 1.2 ft to 5.1 ft, 3,200 yds^3.

Historical sample locations are shown on Figure 2.

Planned Sampling Activities

A Soil Sampling Investigation Work Plan (MPC 2019) was submitted and approved by the NMED in September 2019 (NMED 2019), and consisted of the following major elements:

- Samples collected using a hand-auger in locations predetermined by the RCRA Post-Closure Permit guidelines.
- Three sampling locations in each of the two aeration ponds and four sampling loctions in the evaporation pond to a depth of 8 ft or refusal.
- Pond berm sampling at locations along each of the pond berms (four berms/pond), starting at the top and then at an interval of 2.5 vertical ft and a depth of 1.5 ft in as near a horizontal direction as possible.
- Analysis of samples using field screening with a flame ionization detector (FID), and submission of laboratory samples for analysis of VOCs by Method 8260, SVOCs by Method 8270, metals by Method 6010, mercury by Method 7471, TPH-GRO, TPH-DRO, TPH - motor oil range (ORO), and TCLP analysis for lead, mercury, and benzene were planned. Free liquids, pH, and specific gravity were also analyzed by the laboratory.

- Duplicate samples for the purpose of quality assurance.

- Analytical results comparison against NMED I~~ndustrial~~ SSLs, TCLP and the ~~USEPA~~ NMED ~~Industrial~~ Residential Soil Screening Levels (RSSLs). The hazardous waste determination was completed using the TCLP standards compared against the benzene, mercury, and lead results.

Deviations from Approved Plan

Deviations from the sampling plan approved by NMED (NMED 2019) included the following:

1. Samples were to be collected at the surface and every 2.5 ft to a maximum depth of 8 ft; however, during the sampling it became apparent that immediately below the surface sediment was a homogeneous black sludge that varied in thickness above a visually distinct native clay liner. Attachment A provides the field notes from the sampling event. It was decided that only a surface, one sludge, and one native clay sample would be collected from each location in the basins.

2. Despite dewatering with a vac truck throughout the week, ~~AP~~AL-1 and ~~AP~~AL-2 pond surfaces remained too unstable to collect samples from some of the planned locations. One sample location from ~~AP~~AL-1 and all three sample locations from ~~AP~~AL-2 had to be moved closer to shore than previously planned. In addition, due to these safety concerns, the native clay liner samples were taken only to a depth of 6 to 12 inches into the native clay rather than to the planned 8-foot depth. Sample locations and depths are shown on Figure 2 and summarized in Table 1.

3. While equipment blanks were not collected, MPC does not believe the integrity of the samples was compromised. Several factors were considered in making this determination.

   In MPC Response Comment 2, it was shown that 91% of the bottom clay liner analyses from AL-1, AL-2, and EP-1 were below ISSLs for TPH (GRO/DRO/ORO). This indicates that the bottom clay samples were not significantly cross-contaminated by the sludge from the interval immediately above the bottom clay or from potential cross-contamination between sample locations. The remaining 9% of the bottom clay liner analyses were most likely impacted in-situ, not as a result of sampling.

   In addition, within each borehole, after collection of the overlying sludge sample, the hand auger had to be pushed through the sloughing black sludge to the bottom clay liner to collect the sample, so that decontamination and the importance of an equipment blank was minimal due to the issue with having to sampling the clay through the sludge. To eliminate as much cross-contamination as possible to the clay layer, the outer black sludge was removed from the clay sample, so only clay was placed in the sample jar. In addition, gloves were changed between sludge and clay sample collection. Finally, the augers were decontaminated between boreholes, including washing and rinsing to remove all visible traces of sludge.

~~The sampling plan specified equipment blank collection at a frequency of 10% of samples collected. These samples were not collected. The hand auger was decontaminated prior to each sample depth by brushing off soil and by cleaning off~~

~~any sludge until the surface of the hand auger was visibly clean. The hand auger and spade were decontaminated using Simple Green™ between each sample location.~~

~~2.~~4. The planned sampling activities included field screening with an FID. The FID received from the rental agency would not stay lit after the first day of use and a replacement was ordered. The replacement FID would not function. Due to repeated technical issues with the FIDs, only samples from the first day (approximately 20) were able to be screened in the field. While all field data were not screened, there was sufficient FID data to establish a positive correlation between the FID results and the laboratory VOC and SVOC data.

~~3.~~5. TCLP benzene analyses were performed on those samples where benzene soil concentrations exceeded 0.5 mg/kg, rather than all samples. This was a screen recommended by the laboratory Hall Environmental to optimize the number of benzene TCLP analyses.

~~4.~~6. The TCLP mercury samples, which were proposed in the approved investigation work plan, were analyzed within the holding time. Although the mercury soil analyses exceeded the holding times for the EPA Method 7471, this analysis was not proposed in the approved investigation work plan and was requested later to provide additional information on mercury concentrations across the ponds. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the Code of Federal Regulations (CFR) TCLP screening level of 0.2 milligrams per liter (mg/L). ~~Total mercury was inadvertently left off the original chain-of-custody (COC) that was sent to the laboratory. The laboratory had enough remaining sample left to analyze for total mercury, but it was completed outside the holding time of 28 days. Samples of mercury that were reported as not detected are considered unusable due to the length of time between sampling and analysis. It should be noted that mercury TCLP was analysed~~analyzed at each locations and none exceeded the TCLP standard.

~~5.~~7. A Tier I data validation was completed on all the samples. Tier II data validation will be completed on the confirmation results following excavation of SWMU 1. The Tier I validation reviewed potential problems with the data and did not identify possible biases or errors in the lab data. The data were considered accurate for the purposes of excavation delineation and waste disposal determination.

~~6.~~8. A comparison of the analytical results to Land Disposal Restrictions (LDRs) is not submitted in this report; but following selection of the waste treatment/disposal firms MPC will complete the LDR form and comparison.

Field Investigation Results

Trihydro conducted the sampling January 13-17, 2020. The samples were collected from 22 locations, including 10 pond sediment and 12 berm locations. Pond or toe sample depths ranged from surface collection to 6.5 ft below ground surface (bgs). Though designated toe samples, toe samples are effectively pond samples because they ~~showed~~ exhibit the same silty, sandy surface layer underlain by three to five feet of sludge, which lies above the native clay liner. Berm locations were taken from the inside of the pond to a vertical depth of 9 ft through the top of berm. The samples were generally collected in the locations presented in the Soil Sampling Investigation Work Plan (MPC 2019) but deviated slightly based on the conditions observed in the pond and lagoons during the sampling, as discussed above.

Summary of Field Sampling Activities

A total of 97 samples plus 10 duplicate samples and 5 trip blanks were collected from the three ponds. A summary of samples and locations are shown on Figure 2 and in Table 1.

Sampling began on the top and sidewall berms of the three ponds while AL-1 and AL-2 fluid was being removed with a vac truck. Several samples were identified as toe and berm samples. The toe samples were collected starting with sediment taken from the base of the berm, including any surface soil, another sample was taken of any sludge, and lastly a native clay sample was taken from below the sludge. Although these samples are classified as toe samples, they are, in fact, pond samples due to the presence of several feet of sludge. Surface samples on the pond and lagoons were taken with a spade and placed in a Ziplock bag. The hand auger was then advanced down through the sludge to the hard-packed native clay liner to determine the depth to the top of the native clay liner. The sludge sample was extracted from the hand auger as it came out of the hole and placed in a Ziplock bag. Dry decontamination of the auger by brushing and scraping was conducted between depths. Then the hand auger was used to obtain a sample of the native clay liner. Generally, penetration into the native clay was limited to approximately 1 foot because of difficulty turning the auger in the native clay. The field geologist visually observed the samples and recorded the observations in the field notebook. The hand auger and spade were decontaminated using Simple Green™ between each sample location.

Headspace sampling of the samples was conducted using an FID. Only samples collected on Monday, January 13, 2020 were sampled with the FID, as the FID and its replacement would not operate properly; specifically, the flame would not stay lit. The piece of equipment delivered onsite failed but the information that the FID provided while operational showed a clear correlation between contamination and elevated FID readings. Higher DRO results generally corresponded with higher FID readings. In future investigations, an additional functional FID unit will be kept on-site.

The sludge in the aeration lagoons has been accumulating since the refinery was built. These sludges consist of heavily weathered hydrocarbon products. A PID is designed to detect light volatile organic compounds (VOC) such as benzene, toluene, ethylbenzene, and xylene compounds. Additionally, a PID does not work well with pond sediments due to the moisture content of the sediments. An FID is designed to detect a broader range of compounds such as long-chained hydrocarbons, also known as SVOCs, in addition to the VOCs. Because both AL-1 and AL-2 are aeration lagoons, most of the lighter VOCs had volatilized or degraded during aeration leaving the heavier SVOCs in the sludge and hydrocarbon that infiltrated the underlying clay liner. Based on the above, an FID was selected for screening the soils and sludges as it would be able to detect the heavier hydrocarbons, as well as the lighter hydrocarbons.

The samples were placed in laboratory provided sample containers, labeled, and placed in a cooler, iced, and delivered to Hall Environmental Laboratories for analysis for VOCs by USEPA Test Method 8260B; SVOCs by USEPA Test Method 8270C; TPH by USEPA Test Method 8015M; total metals by USEPA Test Methods 6010B and 7471; benzene TCLP by USEPA Test Method 8260B; mercury and lead TCLP by USEPA Test Methods 7470 and 1311/6010A, pH, specific gravity, and free liquids (paint filter).

Field Observations of Pond Conditions

EP-1

The toe of each EP-1 berm had 6 to 12 inches of surface sediment, underlain by up to 3 ft of black sludge overlying a native clay layer. The native clay layer in the toe samples showed little to no visual evidence of staining, and the transition in color and texture from black sludge to native unstained clay was obvious. Samples in EP-1 were taken in locations as indicated in the workplan. The samples taken within the pond had minimal surface sediment with 3 to 5 ft of sludge overlying the native clay layer. Surface water was observed on approximately a quarter of the pond area. Groundwater was not encountered during the sampling.

AL-1

AL-1 conditions required sample SWMU 1-8 to be collected closer to the shoreline than the work plan proposed due to safety concerns as shown on Figure 2. Samples were collected using a pallet as a sampling platform. Samples consisted of 3 to 6 inches of surface sediment underlain by 4 to 6 ft of sludge overlying a native clay layer. As with EP-1, the transition from black sludge to unstained native clay was obvious. The maximum sample depth was dictated by the native clay layer. Samples were generally taken up to 6 to 12 inches into the native clay layer, after which it was deemed unsafe to continue due to the unstable sampling platform. Surface water was observed on approximately a third of the pond area, prior to vac truck removal, which reduced the surface water coverage to approximately 25% of the area. Groundwater was not encountered during the sampling.

AL-2

Conditions in AL-2 were similar to AL-1, but with more saturated conditions. AL-2 conditions required all sampling to be collected closer to the shoreline than the workplan indicated due to safety concerns (Figure 2). Samples consisted of 0 to 6 inches of surface sediment underlain by 4 to 5.5 ft of sludge overlying a native clay layer. As in AL-1, the maximum sample depth was dictated by an unstained native clay layer, which was readily discernible. Samples were taken 6 to 12 inches into a native clay layer, after which it was deemed unsafe to continue. Surface water was observed on approximately a third of the pond area prior to vac truck removal, which reduced the surface water coverage to approximately 25% of the area. Groundwater was not encountered during the sampling.

Quality Assurance/Quality Control Samples

Quality assurance/quality control (QA/QC) samples were recorded on the field forms.

Laboratory Analytical Results

Analytical results for exceeded detections of the various parameters are presented in the following tables:

- Table 2 – VOCs
- Table 3 – SVOCs
- Table 4 – Metals

Results are organized in these tables by pond. Tables with all the sampling results compared to the soil standards are included in Attachment B. Analytical laboratory reports are included in Attachment C. The ranges of detected

concentrations of analytes are summarized in the sections below. An interpretation of the results, including a comparison to the standards, is also presented below. The sample locations are shown on Figure 2 and summarized in Table 1.

VOCs

The detected exceedance sample results of VOCs are provided in Tables 2a through 2c. A complete summary of all sample results is included in Attachment ~~C~~B. Exceedances were observed in DRO, GRO, and Oil Range Organics (ORO) across the pond and lagoons. The NMED ~~Industrial Soil Screening Levels (~~ISSL~~)~~ for DRO and ORO are both 3,000 milligrams per kilogram (mg/kg) and 500 mg/kg for GRO. The NMED R~~esidential~~ SSL for DRO and ORO are both 1,000 mg/kg and 100 mg/kg for GRO. The detections were generally higher in locations sampled closer to the surface, and as shown in Appendix ~~C~~B Tables 1A, 1B and 1C, the concentrations relatively abruptly (several orders of magnitude) decrease with depth as the clay is encountered.. No other VOC detections exceeded the standards.

Benzene samples with concentrations greater than 0.5 mg/kg were analyzed for TCLP benzene. Only 8 samples from AL-1 met this criterion. No detections of benzene exceeded the NMED SSL's of 87.24 mg/kg for an Industrial Worker. No detections of benzene TCLP exceeded the 40 CFR 261.24 TCLP Screening Level of 0.5 mg/kg.

SVOCs

The detected exceedance sample results of SVOCs are provided in Tables 3a through 3c. 1-methylnaphthalene, 2-methylnaphthalene, and naphthalene exceeded their respective NMED ~~Residential R~~RS~~SL's~~ and the USEPA RSL's, but these analytes did not exceed the NMED I~~ndustrial~~ SSL. Benzo(a)anthracene and benzo(a)pyrene exceeded all three of the standards in one location, SWMU 1-9 in the surface sample. Benzo(a)pyrene exceeded the NMED ~~Residential~~ RSSL and USEPA RSL for SWMU 1-9 at 4.5 ft. No other exceedances were observed.

Metals

The detected exceedance sample results of metals are provided in Tables 4a through 4c. Exceedances were observed for arsenic, antimony, and mercury compared to the USEPA RSL and the NMED R~~esidential~~ SSL. Arsenic did not exceed the ~~Industrial~~ NMED ~~RSL~~ ISSL and a standard for mercury has not been established for NMED. Antimony exceeded the ~~Residential~~ NMED RSSL in two locations, SWMU 1-20 (toe) (0.5 – 3 ft) and SWMU 1-11 (toe). Lead did not exceed any of the applicable screening levels. The TCLP results for mercury and lead did not exceed the screening levels from 40 CFR 261.24.

Although the mercury analyses exceeded the holding times for the EPA Method 7471, this analysis was not included in the approved investigation work plan, thus not required. The TCLP mercury results, which were included in the approved investigation work plan, were analyzed within the holding time. TCLP mercury results for all samples (berm and pond) were several orders of magnitude below the CFR TCLP screening level of 0.2 mg/L. Therefore, additional sampling, other than confirmation samples collected after excavation, will not be necessary.

General Chemistry

Sample results of general chemistry analyses, pH, free liquids, and specific gravity are provided in Table 5. The pH ranged from 3.48 in SWMU 1-19 (toe) to 9.13 in SWMU 1-22 ((toe) (3.5-4 ft)) with an average pH for all the samples of

7.52. Specific gravity ranged from 1.03 g/cm^3 in SWMU 1-12 (toe) to 2.21 g/cm^3 in SWMU 1-17 ((berm) (1.5 ft)). Free liquids were analyzed and resulted in a positive or negative result (paint filter test). Of the 97 sample locations only six resulted in a positive paint filter test resulting in the sample having free liquid. Those locations are: SWMU 1-10 (4-4.5 ft), SWMU 1-18 (toe), SWMU 1-18 (toe) (2.5 ft), SWMU 1-20 (toe) (0.5-3 ft), SWMU 1-8 (2.5 ft), and SWMU 1-9 (4.5 ft). A summary of the free liquid detected during sampling is shown on Figure 3.

The standing water observed in AL-1 and AL-2 is likely perched within the pond clay liners and is not representative of the deeper water table. This standing water is likely from precipitation, with a possible contribution from shallow groundwater seepage (< 6 ft in depth). Test pits proposed for areas adjacent to AL-1 and AL-2 will assist in determining the potential for significant seepage which could affect waste excavation. The deeper groundwater may be present at lower depths in EP-1. For example, the depth to water in local monitoring wells GWM-1 (northwest corner of EP-1) in 2016 (2016 Annual Report) was approximately 22 ft below grade, GWM-2 and GMW-3 were dry (total depths approximately 18 and 19 ft below grade, respectively).

Pond Berm Analytic Results Summary

Soils outside of the berms were not sampled, as this was not proposed as part of the approved work plan. Other, earlier, samples outside of the bermed areas were collected, as shown on Figure 2. These results showed that only one sample (SWMU 1-1 (2-4 ft), of the 17 soil borings advanced along the berm of all three ponds, exceeded ISSL and RSSL. This boring was located near the discharge lines coming from the new American Petroleum Institute separator (Western Refining 2013). All wastewater flow was discontinued by June 2013 when the flow was diverted to the new wastewater treatment plant (Western Refining 2013). Therefore, additional seepage into the berm would not be expected since mid-2013.

Based on the berm sampling results shown in Table 7, shallow berm soils can likely be segregated in the field during excavation and composite sampled to determine suitability as backfill. Deeper berm soils and soils outside of the berms can be assessed during excavation on the basis of physical appearance, odor, and FID field screening, segregated if necessary, and sampled. ~~Table 6 presents berm analytical results, with those berm sample results exceeding standards shown in bold. Table 8 for berm soil results has been added covering the frequency of detections below standards. While FID results were limited to the first day, these results show a positive correlation between FID results and DRO/ORO results. As noted in MPC Response 2 above, Tables 2A, 2B, and 2C show only exceedances, not every sample result.~~

~~Of the three sample locations and eight samples in AL-1, three sample locations showed TPH (GRO/DRO/ORO) results above the ISSL. One sample depth is at 1.5 feet, one is at 2.5 feet, and the last location is at 7.5 feet below the top of the berm. One other location has an analysis result above the RSSL at 2.5 feet. Of the 24 analyses from AL-1, 75 percent were below the ISSL for TPH (GRO/DRO/ORO) (Table 8).~~

~~Two of the eight sample locations at AL-2 had exceedances of TPH (GRO/DRO/ORO). Of the 24 total samples analyzed for TPH (GRO/DRO/ORO), 83 percent of the analyses for TPH (GRO/DRO/ORO) were below the ISSL.~~

~~Of the 17 sample locations at EP-1, only two sample results exceeded the ISSL for TPH (GRO/DRO/ORO) and one exceeded both the ISSL and the RSSL. Of the 51 analyses of samples from AP-1, 92 percent were below the ISSL for TPH (GRO/DRO/ORO) and 88 percent were below both the ISSL and the RSSL.~~

~~In total, 86 percent of the berm samples collected at all three ponds were below the ISSL for TPH (GRO/DRO/ORO). The top sample (1.5 ft) at every berm location, except one location, is below the ISSL and RSSL for TPH (GRO/DRO/ORO). Thirteen of the 18 berm sample locations with TPH (GRO/DRO/ORO) results were less than the ISSL and RSSL at the 2.5-foot level of the berm.~~

~~As indicated in the other responses, visual observation and FID screening can provide a reliable basis for full-scale excavation to proceed, followed by confirmation sampling and laboratory analyses.~~

Pond Clay Liner Analytic Results Summary

A distinct clay liner was encountered in this investigation. This liner was evidenced by its material properties (hand-augering in clay) and unstained color. A better picture of the relatively abrupt decrease with depth of concentrations can be seen from Attachment B Tables 1A, 1B and 1C, where the TPH (GRO/DRO/ORO) results for the pond sediments show a relatively abrupt (several orders of magnitude) decrease in concentration with depth in a boring location as the clay was encountered. For ~~instance~~example, in Attachment B Table 1A, the TPH (GRO/DRO/ORO) results for the lowermost clay sample from all three AL-1 pond sample locations (SWMU 1-8 (5 - 5.5 ft), SWMU 1-9 (5.5 - 6 ft), and SWMU 1-10 (4.5 - 5 ft)) are below both the NMED Industrial Soil Screening Levels (ISSL) and Residential Soil Screening Levels (RSSL) for TPH (GRO/DRO/ORO).

~~-~~To support MPC's assertion that the extent of contamination in the clay is limited, ~~a new table (~~Table 8~~) has been added showing~~presents the frequency of detection above standards for the underlying clay for AL-1, AL-2 and EP-1. Tables 2A, 2B, and 2C show only exceedances, not every sample result. ~~For instance, in Attachment B Table 1A, the TPH (GRO/DRO/ORO) results for the lowermost clay sample from all three AL-1 pond sample locations (SWMU 1-8 (5 - 5.5 ft), SWMU 1-9 (5.5 - 6 ft), and SWMU 1-10 (4.5 - 5 ft)) are below both the NMED Industrial Soil Screening Levels (ISSL) and Residential Soil Screening Levels (RSSL) for TPH (GRO/DRO/ORO).~~

Of the 21 TPH (GRO/DRO/ORO) analyses at the seven sample locations collected from the clay liner in AL-1, which includes the toe samples, 95 percent are below the ISSL and 81 percent are below both the ISSL and RSSL (Table 8). That is five of seven locations are below both the ISSL and RSSL in AL-1 for TPH (GRO/DRO/ORO). Six of the sample locations are below the ISSL for TPH (GRO/DRO/ORO).

Three sample locations out of the six locations collected from the clay liner in AL-2, are below both ISSL and RSSL for TPH (GRO/DRO/ORO). Another sample location is below the ISSL for TPH (GRO/DRO/ORO). Overall, of the 18 analyses from AL-2, 83 percent are below the ISSL and 72 percent are below both the ISSL and the RSSL for TPH (GRO/DRO/ORO).

Six of the nine sample locations from EP-1 were below both ISSL and RSSL for TPH (GRO/DRO/ORO). Only one location had TPH (GRO/DRO/ORO) analyses above both ISSL and RSSL. Of the 27 analyses for TPH (GRO/DRO/ORO) from samples collected from EP-1, 93 percent were below the ISSL and 85 percent were below both the ISSL and RSSL (Table 8). Overall 91 percent of the 66 TPH (GRO/DRO/ORO) analyses collected from all three ponds were below the ISSL.

These results correlate with the color change observed in the clay. Available FID field data also indicate a correlation with TPH-DRO/ORO analytical data (see below). Together, field observations and FID screening should provide a practical, working basis for full-scale excavation in the field. Excavation will be followed by laboratory confirmation sampling of excavation vertical and horizontal extent.

QA/QC Samples

Five methanol blank samples were provided by the laboratory as trip blanks. These samples were sent in the coolers by the laboratory and were not altered between sampling and analysis. Methylene chloride, 1-methylnaphthalene, 2-methylnaphthalene, 1,2,4-trimethylbenzene, 4-methyl-2-pentanone, and toluene were detected in the blank samples. Methylene chloride is a common laboratory contaminant and was detected in all of the laboratory blanks and several of the soil samples. None of the detected blank samples exceeded the standards.

Tier I data validation was performed on the data package provided by the laboratory. The Tier I data validation included a review of the completeness of the data packages, COC's, sample condition receipts, sample preservations, holding times, the case narrative, and the quality control summary. Several notations were provided in the quality control summary provided by the laboratory, but the laboratory determined that the precision, accuracy, validity, and usability of the data were not compromised, and that corrective actions were not necessary. Following a review of the Tier I data validation parameters, it was determined that the data set was generally complete.

Correlation of Analytical Results with FID Field Screening

FID results from the first day were compared to the TPH results from the samples they were analyzed from. The comparison is provided in Table 6. Results with high detections of DRO (greater than 200 mg/kg) had an FID reading greater than 1.5 ions per second. These results indicate a potential positive correlation between the analytical results and soil characteristics in the field. The FID will be used during excavation to confirm that hydrocarbon contaminated soil has been excavated from the lagoons and pond along with visual indicators and laboratory confirmation sampling.

Conclusions

This investigation was conducted to characterize soils and sediments in EP-1, AL-1, and AL-2 for future excavation and closure of SWMU-1. Much of the vertical and horizontal delineation of contamination was achieved. The results provide a firm basis for proceeding with an excavation plan, which will include the field and laboratory sampling procedures. Significant findings include:

- Confirmation that EP-1 soil/sediments are not RCRA hazardous based on the toxicity criteria.

- Estimated volumes for excavation and disposal for EP-1 (non-hazardous) 11,500 yd^3, AL-1 ~~1~~2,700 yds^3 (listed hazardous) and AL-2 ~~3,8~~4,500 yds^3 (listed hazardous).
- Characterization of the berm soil for potential re-use for excavation backfill.
- Pond sediment as consisting of a thick oily sludge, whose composition was confirmed by elevated TPH results.
- Generally, the oily sludge in the ponds had a specific gravity of 1.92, and a pH of 8.66. Of the 106 samples of sludge, only 6 had free liquids in the sample. This shows that the water accumulating in the ponds is likely from outside SWMU 1 and not coming from groundwater. While it is true that all sludge samples should contain liquids, it does not necessarily mean that all sludge contains *free* liquids. Much of the liquid within the sludge was trapped within the sludge at the time of its deposition and appears to be emulsified with petroleum into a gel-like consistency."

  Ponded water observed in AL-1 and AL-2 is likely perched water trapped by the clay layer which underlies the ponds. Based on the shallow water table elevations in the Seeps area to the south, it is also possible that seepage into the ponds is occurring along the southern edge of AL-1 and AL-2.

-
- Based on the analytical data and field observations, the waste excavation of the ponds can be reliably guided by visual observation of the sludge/native clay liner interface, color change of the native clay to a natural grey color, and FID sampling. Confirmation sampling will be conducted following excavation completion including mercury analysis.

Following NMED's review of these results and approval of the characterization of SWMU 1, MPC plans to ~~proceed with~~submit and investigation work plan that is required by NMED before the ~~remedy~~ remedial ~~implementation for the~~ excavation and closure of the SWMU is implemented. MPC plans to engage with a contractor for the excavation and disposal of the ponds. Once the contractor is identified and Waste Acceptance Criteria, including LDRs, are identified based on the contractor's proposed method of treatment and disposal, an excavation sampling plan will be submitted to the NMED for review and approval.

Closure sampling will be completed to confirm that the contaminated soil has been removed and submitted to NMED for review prior to backfill. Similar to this report, following the approval of the closure sampling MPC anticipates the submittal of a Class 3 RCRA permit modification for their Final RCRA Post-Closure Permit.
