1. Introduction

This report discusses field activities completed in 2020 at the Transwestern Pipeline, LLC (Transwestern) Thoreau Compressor Station Number 5 (Site). The Site is situated approximately 1.5 miles north-northwest of Thoreau, McKinley County, New Mexico on the Navajo Nation within Section 20, Township 14 North, Range 13 West (**Figure 1**). The facility is owned by Transwestern and the surrounding land is owned by the Navajo Nation and the Bureau of Land Management. A Site Detail Map is included as **Figure 2**. The Site is regulated by the Navajo Nation Environmental Protection Agency and the New Mexico Oil Conservation Division under abatement plan AP-102.

1.1 Background

In March 1989, Daniel B. Stephens & Associates (DBS&A) was retained by Transwestern to investigate the hydrogeology at four compressor stations. A Consent Decree had been issued by the Environmental Protection Agency (EPA) due to the potential release of polychlorinated biphenyl (PCB) compounds in soils at these sites. Transwestern utilized synthetic lubricating oil containing Aroclor 1242 in a gas turbine, which may have contaminated downstream elements of the Transwestern system. The potential PCB releases may have occurred from natural gas condensate liquid waste generated during pipeline cleaning operations.

The results of this initial investigation revealed the presence of hydrocarbons and PCBs within a shallow alluvial aquifer beneath the Site. However, impacts to the regional aquifer were not found. The Consent Decree was terminated following a determination by the EPA in late 1992. The EPA concluded that Transwestern had met the terms and conditions of the Consent Decree. Following termination of the Consent Decree, Transwestern began working solely with the New Mexico Oil Conservation Division (NMOCD) and the Navajo Nation for Site monitoring and remediation activities to address remaining impacts to the shallow alluvial aquifer.

From April 1992 to December 1992, a nitrate injection pilot test was conducted at the Site in the immediate vicinity of monitoring well (MW) 5-35B. The pilot test was performed to assess the feasibility of nitrate enhanced bioremediation of Site impacts. The pilot test resulted in reductions in concentrations of toluene, xylene, and ethylbenzene; however, no significant reduction in benzene was observed. Following the test, a decision was made to pursue bioremediation based on aerobic rather than anaerobic degradation.

The Phase I soil vapor extraction (SVE) remediation system was placed into service on December 9, 1994. This system consisted of a single 1/2 HP electric regenerative blower which extracted soil vapor from MW 5-35B.

The Phase II system was implemented in 1996 with the installation of 11 air sparge points (AS-1 thru AS-11), two dedicated SVE wells (SVE-1 and SVE-2), and the installation of associated surface equipment. During drilling activities at AS-2, soil impacts originating from a former surface impoundment for gas condensate liquids were discovered. It was determined that this former surface impoundment was likely the primary source of benzene impacts at the Site. The Phase III system was implemented in late 1997 with the addition of five air sparge wells (AS-12 through AS-16) and

two additional SVE wells (SVE-3 and SVE-4). The SVE system was shut down in November 2010 due to declining volatile organic compounds detected in the system influent.

In 2006, during construction to replace the pig receiver, a petroleum hydrocarbon odor was noted as soil was excavated from around the concrete pedestal supporting the receiver. Laboratory analysis of a soil sample from the area revealed elevated total petroleum hydrocarbons (TPH). Subsequently, 130 cubic yards of soil was excavated from the area around the pig receiver and in the area down gradient of the old waste pit. Waste characterization samples were taken from soil stockpiles prior to disposal. The samples revealed elevated TPH in the diesel and motor oil range, as well as trace amounts of PCBs.

Concentrations of PCBs have been detected in groundwater samples collected from two Site wells located in the extreme southeast corner of the facility (MW 5-59 and 5-06C) since 1989. The concentrations of PCBs in these wells have generally been decreasing over time.

Site consulting responsibilities were transferred from Cypress Engineering to GHD in January 2014.

GHD advanced five hollow stem auger borings at the Site to assess residual hydrocarbon concentrations in the soil during the weeks of November 17, 2014 and November 24, 2014. Analytical data from the soil borings indicated residual benzene, toluene, ethylbenzene, and xylenes (BTEX) and TPH concentrations near MW 5-35B and SVE-03.

By 2014, a number of down gradient or dry monitoring wells were no longer viable for data collection. Eleven monitoring wells and two SVE wells were plugged and abandoned during the weeks of November 17, 2014 and November 24, 2014. These wells were plugged and abandoned with the approval of the Navajo Nation Environmental Protection Agency (NNEPA) and the Navajo Nation Water Code Administration (NNWCA).

A work plan to assess the Site for remediation by chemical oxidation was submitted to both the NNEPA and NMOCD, dated September 29, 2015. The work plan included collecting bulk samples and performing treatability testing.

To assist with a treatability study to perform chemical oxidation at the Site, bulk soil and groundwater samples were collected. A bulk composite groundwater sample was collected from 5-02C, 5-35B, and SVE-3 in conjunction with groundwater sampling on April 13, 2015. Two hollow stem auger borings were advanced on October 27, 2015 to collect the bulk soil sample. Enviro Drill, Inc. of Albuquerque, New Mexico performed the drilling using a CME-75 drill rig. The bulk samples were placed in laboratory prepared containers, stored in a cooler on ice, and shipped to the GHD Innovative Technology Group (ITG) laboratory located in Niagara Falls, New York.

Based on the treatability study, in-situ chemical oxidation (ISCO) using a catalyzed sodium persulfate solution was recommended by ITG to address petroleum hydrocarbon impacts.

Injections were performed in air sparge wells AS-4, AS-10, and AS-15 with a sodium persulfate and sodium hydroxide solution during three injection events in 2017. The injections were administered by GHD on March 28, June 26, and October 6, 2017.

Semiannual groundwater monitoring was completed in 2020. Details of 2020 field activities are discussed in this report.

1.2 Hydrogeology

The Chinle Formation is the principal bedrock underlying the Site. The Chinle Formation is comprised primarily of red claystone and mudstones and is roughly 1,000 to 1,300 feet thick. In addition, there is a middle Chinle Formation member, the Sonsela sandstone, which is approximately 90 to 130 feet thick at a depth of approximately 650 feet below ground surface (bgs). The Sonsela sandstone is the shallowest aquifer that is used as a water supply in the Thoreau area.

The Chinle Formation is overlain by 30 to more than 75 feet of alluvium over most of the Site and surrounding area. The alluvium consists of reddish brown, silty sand that is fine to very fine grained, moderately to well sorted, with thin, silty interbeds. Approximately 1 to 5 feet of weathered, sandy clay marks the transition between the surficial alluvium and underlying Chinle Formation.

Perched groundwater is present in the alluvium over the Chinle Formation. The perched zone is approximately 3 feet thick for most of the Site, with the thickness increasing locally due to the presence of paleo channels that occur from the erosion of the Chinle Formation.

2. Groundwater Monitoring Methodology and Analytical Results

2.1 Groundwater Monitoring Summary

Semiannual groundwater monitoring events were performed at the Site on June 16 and 17, 2020 and October 7 and 8, 2020. Prior to collection of groundwater samples, an oil/water interface probe was used to measure depth to groundwater and check for the presence of light non-aqueous phase liquids (LNAPL), if any. Before and after each use, the oil/water interface probe was cleaned with an Alconox®/deionized water solution and rinsed with deionized water. Groundwater gauging data and elevations are detailed in **Table 1**. Groundwater potentiometric surface maps showing June and October 2020 gauging data are presented as **Figure 3** and **Figure 4**, respectively. The apparent groundwater flow at the Site is to the southwest and is consistent with historical data. The groundwater gradient was calculated at 0.020 feet per foot (ft/ft) in June and 0.016 ft/ft in October 2020.

2.2 Groundwater Monitoring Methodology

During the 2020 semiannual monitoring events, MWs 5-16B, 5-18B, 5-20B, 5-35B, 5-06C, 5-59, AS-04, AS-10, AS-15, and SVE-3 were purged of at least three well volumes or until dry using dedicated, polyethylene bailers. While purging each well, groundwater parameter data including temperature, pH, conductivity, and oxidation reduction potential were collected using a multi-parameter groundwater quality meter. Field parameters are summarized on **Table 2**. Groundwater samples were placed in laboratory prepared containers, packed on ice, and delivered under chain-of-custody documentation to Hall Environmental Analysis Laboratory in Albuquerque, New Mexico.

Groundwater samples collected from MWs 5-16B, 5-18B, 5-20B, 5-35B, 5-06C, 5-59, AS-04, AS-10, AS-15, and SVE-3 were analyzed for BTEX by EPA Method 8260, sulfate by EPA Method 300.0,

and dissolved iron and manganese by EPA Method 6010B. Groundwater samples collected from monitoring wells 5-06C and 5-59 were also analyzed for PCBs by EPA Method 8082. A summary of analytical results for BTEX constituents is presented on **Table 3**. A summary of analytical results for PCBs is presented on **Table 4**. A summary of specific ISCO monitoring BTEX analytical results, as well as those for sulfate, is presented on **Table 5**. BTEX and PCB concentrations for the 2020 semiannual sampling events are shown on **Figure 5**.

2.3 Groundwater Monitoring Analytical Results

The NNEPA mandates that groundwater quality on the Navajo Nation be protected pursuant to the Navajo Nation Safe Drinking Water Act and the Navajo Nation Clean Water Act. Groundwater quality standards for the NNEPA follow the National Primary Drinking Water Regulation, Maximum Contaminant Levels (MCLs) set by the EPA.

Any constituents of concern that were detected in groundwater samples above EPA MCLs are listed below.

Results of the June 2020 groundwater monitoring event are as follows:

- **LNAPL:** LNAPL was observed in well 5-02C while purging in an attempt to collect a groundwater sample. The well was subsequently not sampled due to the presence of LNAPL.
- **Benzene:** The EPA MCL for benzene is 5 micrograms per liter ($\mu\text{g}/\text{L}$). Groundwater samples collected from wells 5-16B, 5-35B, SVE-3, AS-4, AS-10, and AS-15 contained benzene at concentrations ranging from 14 $\mu\text{g}/\text{L}$ to 3,700 $\mu\text{g}/\text{L}$.
- **PCBs:** The EPA MCL for PCBs is 0.5 $\mu\text{g}/\text{L}$. Groundwater samples collected from wells 5-06C and 5-59 contained PCBs at concentrations of 2.0 $\mu\text{g}/\text{L}$ and 3.1 $\mu\text{g}/\text{L}$, respectively.
- **Sulfate:** The EPA secondary drinking water standard for sulfate is 250 mg/L. The sulfate concentration in SVE-3 was 5,400 mg/L, AS-4 was 530 mg/L, AS-10 was 8,700 mg/L, and AS-15 was 16,000 mg/L. The elevated concentrations of sulfate are a result of the 2017 ISCO injections that utilized a catalyzed sodium persulfate solution as an oxidant.

Results of the October 2020 groundwater monitoring event are as follows:

- **LNAPL:** LNAPL was observed in MW 5-02C while purging in an attempt to collect a groundwater sample. The well was subsequently not sampled due to the presence of LNAPL.
- **Benzene:** The EPA MCLs for benzene is 5 micrograms per liter ($\mu\text{g}/\text{L}$). Groundwater samples collected from MWs 5-16B, 5-35B, SVE-3, AS-4, AS-10, and AS-15 contained benzene at concentrations ranging from 32 $\mu\text{g}/\text{L}$ to 4,100 $\mu\text{g}/\text{L}$.
- **PCBs:** The EPA MCLs groundwater quality standard for PCBs is 0.5 $\mu\text{g}/\text{L}$. The groundwater sample collected from MW 5-06C and 5-59 contained PCBs at concentrations of 2.1 $\mu\text{g}/\text{L}$ and 2.5 $\mu\text{g}/\text{L}$, respectively.
- **Sulfate:** The EPA secondary drinking water standard for sulfate is 250 mg/L. Sulfate concentration in well SVE-3 was 8,000 mg/L, AS-4 was 6,900 mg/L, AS-10 was 4,900 mg/L and

AS-15 was 7,000mg/L. The elevated concentrations of sulfate are a result of the 2017 ISCO injections that utilized a catalyzed sodium persulfate solution as an oxidant.

To address the elevated sulfate levels associated with the 2017 ISCO injections of catalyzed sodium persulfate solution, a fresh water injection was performed July 1 to 3, 2019. The fresh water injections were approved by the NMOCD during an annual meeting conducted between NMOCD, GHD, and Energy Transfer in April of 2019. NNEPA further approved fresh water injections via email correspondence in June of 2019. Approximately 250 gallons of fresh water were injected into wells AS-4, AS-10, AS-15, and 5-37I. Sulfate concentrations in these wells generally decreased as a result of the addition of fresh water. Concentrations were observed to have rebounded slightly in some of the wells that received fresh water, but the downward trend in sulfate was again observed throughout the end of 2020 semiannual monitoring. Sulfate concentrations should continue to decrease over time.

A copy of the laboratory analytical reports for the semiannual monitoring event is included in Appendix A.

3. ISCO Monitoring Results

ISCO treatment has been performed at the Site to target residual benzene concentrations. MWs SVE-3, 5-35B, AS-4, AS-10 and AS-15 are located in the treatment area. Sulfate data indicates that the oxidant (sodium persulfate) made significant contact with AS-4, AS-10 and AS-15. Benzene concentrations in AS-4 are currently below criteria as of the end of 2020. Concentrations of benzene in AS-15 were reduced to low levels in 2018 and 2019 but have rebounded in 2020. Benzene concentrations in AS-10 may have been reduced by previous ISCO events but have been rebounding since 2018. Sulfate data indicate that the oxidant did not make significant contact with SVE-3 and MW 5-35B. Overall, it appears that benzene concentrations were reduced in wells that made contact with the oxidant, however in some locations these concentrations are rebounding.

4. Conclusions and 2021 Recommendations

4.1 Conclusions

Based on the information and data presented in this report, GHD makes the following conclusions:

- Groundwater flow within the perched aquifer at the Site is to the southwest and is relatively consistent with historical data.
- Groundwater from Site monitoring wells still contains benzene and PCB concentrations above the EPA MCLs.
- LNAPL was observed in MW 5-02C during both 2020 monitoring events.
- Sulfate concentrations remain elevated in wells where sodium persulfate was injected in 2017, but did decrease following the NMOCD and NNEPA approved freshwater injection completed in

July, 2019. A rebound of sulfate concentrations has been observed but the over all trend as of the end of 2020 is decreasing.

4.2 2021 Recommendations

Based on the findings listed above, GHD recommends the following for 2021:

- Sample MW 5-48B if sufficient volume is present in order to further monitor conditions in SVE-3.
- Continue semiannual groundwater monitoring.
- Utilize hydrocarbon absorbent socks in MW 5-02C to address the presence of LNAPL.
- Continue to assess the effectiveness of ISCO via monitoring concentrations of sulfate, iron (dissolved and total), as well as dissolved manganese in select monitoring, SVE, or AS wells to determine the potential for continuation or modification of in-situ remediation activities.

All of Which is Respectfully Submitted,

Notes:

mg/L = milligrams per liter

°C = degrees Celsius

uS/cm = microsiemens per centimeter

-- = not measured

3999* is the max that meter can read

Notes:

ug/L = micrograms per liter

EPA = Environmental Protection Agency

NPDWR = National Primary Drinking Water Regulation

NA = Not Analyzed

< x = concentration below laboratory detection limit of x

Bold = exceeds NPDWR standard

LNAPL = light non-aqueous phase liquid

RE: Thoreau

OrderNo.: 2006950

Dear Christine Mathews:

Hall Environmental Analysis Laboratory received 13 sample(s) on 6/17/2020 for the analyses presented in the following report.

These were analyzed according to EPA procedures or equivalent. To access our accredited tests please go to www.hallenvironmental.com or the state specific web sites. In order to properly interpret your results, it is imperative that you review this report in its entirety. See the sample checklist and/or the Chain of Custody for information regarding the sample receipt temperature and preservation. Data qualifiers or a narrative will be provided if the sample analysis or analytical quality control parameters require a flag. When necessary, data qualifiers are provided on both the sample analysis report and the QC summary report, both sections should be reviewed. All samples are reported, as received, unless otherwise indicated. Lab measurement of analytes considered field parameters that require analysis within 15 minutes of sampling such as pH and residual chlorine are qualified as being analyzed outside of the recommended holding time.

Please don't hesitate to contact HEAL for any additional information or clarifications.

ADHS Cert #AZ0682 -- NMED-DWB Cert #NM9425 -- NMED-Micro Cert #NM0901

Sincerely,

A handwritten signature in black ink, appearing to read "Andy Freeman".

Sample Log-In Check List

Client Name: GHD

Work Order Number: 2006950

RcptNo: 1

Received By: Andy Freeman 6/17/2020 2:20:00 PM

Completed By: Leah Baca 6/18/2020 9:00:30 AM

Reviewed By: LB 6/18/2020

Chain of Custody

1. Is Chain of Custody complete? Yes No Not Present
2. How was the sample delivered? Client

Log In

3. Was an attempt made to cool the samples? Yes No NA
4. Were all samples received at a temperature of >0° C to 6.0°C Yes No NA
5. Sample(s) in proper container(s)? Yes No
6. Sufficient sample volume for indicated test(s)? Yes No
7. Are samples (except VOA and ONG) properly preserved? Yes No
8. Was preservative added to bottles? Yes No NA
9. Received at least 1 vial with headspace <1/4" for AQ VOA? Yes No NA
10. Were any sample containers received broken? Yes No
11. Does paperwork match bottle labels?
(Note discrepancies on chain of custody) Yes No
12. Are matrices correctly identified on Chain of Custody? Yes No
13. Is it clear what analyses were requested? Yes No
14. Were all holding times able to be met?
(If no, notify customer for authorization.) Yes No

of preserved bottles checked for pH:
<2 or >12 unless noted
Adjusted? _____
Checked by:

Special Handling (if applicable)

15. Was client notified of all discrepancies with this order? Yes No NA
