**UPSET FLARING EVENT SPECIFIC JUSTIFICATIONS FORM****Facility:** Red Tank 27-28 CTB**Flare Date:** 02/14/2022**Duration of event:** 50 minutes**MCF Flared:** 67**Start Time:** 05:40 PM**End Time:** 06:30 PM**Cause:** Downstream Activity Issue > DCP > DCP Linam Ranch > Facility Issues**Method of Flared Gas Measurement:** Gas Flare Meter**Comments:** This upset event was not caused by any wells associated with the facility.

---

**1. Reason why this event was beyond Operator's control:**

The emissions event was caused by the unforeseen, unexpected, sudden, and unavoidable interruption, restriction, or complete shut-in of a gas pipeline by a third-party downstream pipeline operator, which impacted Oxy's ability to send gas to a third-party downstream gas pipeline. This interruption, restriction, or complete shut-in of the gas pipeline by a third-party pipeline operator is downstream of Oxy's custody transfer point and out of Oxy's control to avoid or prevent from happening and did not stem from any of Oxy's upstream facility activity that could have been foreseen and avoided, and could not have been avoided by good design, operation, and preventative maintenance practices. In this case, OXY was not provided with advance notice, from DCP or DCP Linam Ranch that unexpected gas restrictions or constraints of their gas service pipeline would occur. DCP Linam Ranch gas plant was experiencing issues within their gas service pipeline system, due to hydrate issues which caused their HiLo valve to suddenly and unexpectedly shut down. DCP's unexpected and without warning shut down of their HiLo valve then instigated high discharge pressure to occur, which in turn caused Oxy's upstream facility, Red Tank 27-28 CTB, to high pressure up, triggering a flare event when Oxy was unable to push its gas into the DCP gas service system pipeline. As a result of the reduction in the gas intake volume from the DCP Linam Ranch gas plant, DCP's associating downstream facilities, then restricted their sales gas service system pipeline, also causing high discharge pressure to occur resulting in a constraint of the intake of gas from Oxy. This situation was out of OXY's control but OXY made every effort to control and minimize emissions as much as possible while DCP & DCP Linam Ranch was down and had restricted/constrained their gas service pipeline operations. All OXY compression equipment were running at maximized capacity with no issues until DCP and DCP Linam Ranch had facility and/or equipment issues due to hydrates which prompted their HiLo valve to shut down and subsequent restrictions/constraints of their pipeline service operations. OXY routed its stranded gas to flare until DCP/Linam Ranch was able to resume normal working operations and begin taking gas again.

**2. Steps Taken to limit duration and magnitude of venting or flaring:**

It is OXY's policy to route its stranded gas to a flare during an unforeseen and unavoidable emergency or malfunction, as the part of the overall process or steps to take to limit duration and magnitude of flaring. Oxy personnel are in the field 24/7 and can physically see when we are flaring which in turn are communicated to additional Oxy field personnel. Internal OXY procedures ensure that upon notice of flaring, malfunction gas compressor unit and/or multiple unit shutdown alarms, increased sensor line pressure alarms, etc., field production technician personnel are promptly notified, and are instructed to assess the issue as soon as possible

to take prompt corrective action and minimize emissions. Oxy production technicians must assess whether the issue or circumstance is due to damage and repair is needed, or whether there are other reasons for its cause. In this case, Oxy routed its stranded gas to flare, during both shut in episodes, until DCP was able to resume normal working service operations. In this case, because of the reduction in the gas intake volume from the DCP Linam Ranch gas plant, DCP's associating downstream facilities, then restricted their sales gas service system pipeline, also causing high discharge pressure to occur resulting in a constraint of the intake of gas from Oxy. This situation was out of OXY's control but OXY made every effort to control and minimize emissions as much as possible while DCP & DCP Linam Ranch was down and had restricted/constrained their gas service pipeline operations. All OXY compression equipment were running at maximized capacity with no issues until DCP and DCP Linam Ranch had facility and/or equipment issues due to hydrates which prompted their HiLo valve to shut down and subsequent restrictions/constraints of their pipeline service operations. OXY routed its stranded gas to flare until DCP/Linam Ranch was able to resume normal working operations and begin taking gas again. Oxy made every effort to shut in as much of production/wells as possible, yet it was critical to Oxy's operational safety and start up procedures to allow some production to occur at this facility, as it was necessary to maintain a minimal amount of gas flow to restart the facility's compression equipment, when DCP was ready and able to start taking gas. The minimal amount of gas flow allowed to be produced and flare was done out of necessity to protect personnel and equipment as a safeguard against potential issues that could occur when restarting production at the Red Tank 27-28 CTB facility.

### **3. Corrective Actions taken to eliminate the cause and reoccurrence of venting or flaring:**

Oxy is limited in its corrective actions to eliminate the cause and potential reoccurrence of a DCP sales gas service system pipeline constraint/restriction or shut in, as this control issue is downstream of Oxy's custody transfer point and out of Oxy's control to avoid or prevent from happening or reoccurring. DCP's downstream facility issues will reoccur from time to time and may trigger a spike in their gas line pressure, which in turn, directly impacts Oxy's ability to send gas to them. When DCP's downstream facility and/or its associating downstream facilities has issues or greatly struggles to handle the volume of gas being sent to them by Oxy, DCP then restricts Oxy's ability to send gas, which then prompts Oxy to route its stranded gas not pushed into the DCP sales gas pipeline, to flare. OXY makes every effort to control and minimize emissions as much as possible. The limited reactive actions that Oxy can do in this circumstance is to shut in multiple high GOR wells to minimize gas throughput to match and reduce flaring volumes during this third-party pipeline operator gas service pipeline shut in as well as continually communicate with DCP personnel throughout these type of situations.

**Determination of Reporting Requirements**

Answer all questions that apply. The Reason(s) statements are calculated based on your answers and may provide additional guidance.

|                                                                                                            |                                                   |
|------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| Was this vent or flare caused by an emergency or malfunction                                               | Yes                                               |
| Did this vent or flare last eight hours or more cumulatively within any 24-hour period from a single event | No                                                |
| Is this considered a submission for a vent or flare event                                                  | Yes, minor venting and/or flaring of natural gas. |

An operator shall file a form C-141 instead of a form C-129 for a release that, includes liquid during venting and/or flaring that is or may be a major or minor release under 19.15.29.7 NMAC.

|                                                                                                                                                                                                                                                                                            |     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Was there <b>at least 50 MCF</b> of natural gas vented and/or flared during this event                                                                                                                                                                                                     | Yes |
| Did this vent or flare result in the release of <b>ANY</b> liquids (not fully and/or completely flared) that reached (or has a chance of reaching) the ground, a surface, a watercourse, or otherwise, with reasonable probability, endanger public health, the environment or fresh water | No  |
| Was the vent or flare within an incorporated municipal boundary or withing 300 feet from an occupied permanent residence, school, hospital, institution or church in existence                                                                                                             | No  |

**Equipment Involved**

|                                                           |                                                                                       |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------|
| Primary Equipment Involved                                | Other (Specify)                                                                       |
| Additional details for Equipment Involved. Please specify | Emergency Flare > Downstream Activity Issue > DCP > DCP Linam Ranch > Facility Issues |

**Representative Compositional Analysis of Vented or Flared Natural Gas**

Please provide the mole percent for the percentage questions in this group.

|                                                              |    |
|--------------------------------------------------------------|----|
| Methane (CH4) percentage                                     | 71 |
| Nitrogen (N2) percentage, if greater than one percent        | 3  |
| Hydrogen Sulfide (H2S) PPM, rounded up                       | 0  |
| Carbon Dioxide (CO2) percentage, if greater than one percent | 4  |
| Oxygen (O2) percentage, if greater than one percent          | 0  |

If you are venting and/or flaring because of Pipeline Specification, please provide the required specifications for each gas.

|                                                     |               |

| For this event, this operator could not have reasonably anticipated the current event and it was beyond this operator's control. | True                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Please explain reason for why this event was beyond this operator's control                                                      | In this case, OXY was not provided with advance notice, from DCP or DCP Linam Ranch that unexpected gas restrictions or constraints of their gas service pipeline would occur. DCP Linam Ranch gas plant was experiencing issues within their gas service pipeline system, due to hydrate issues which caused their HiLo valve to suddenly and unexpectedly shut down. DCP's unexpected and without warning shut down of their HiLo valve then instigated high discharge pressure to occur, which in turn caused Oxy's upstream facility, Red Tank 27-28 CTB, to high pressure up, triggering a flare event when Oxy was unable to push its gas into the DCP gas service system pipeline. As a result of the reduction in the gas intake volume from the DCP Linam Ranch gas plant, DCP's associating downstream facilities, then restricted their sales gas service system pipeline, also causing high discharge pressure to occur resulting in a constraint of the intake of gas from Oxy. This situation was out of OXY's control but OXY made every effort to control and minimize emissions as much as possible while DCP & DCP Linam Ranch was down and had restricted/constrained their gas service pipeline operations. All OXY compression equipment were running at maximized capacity with no issues until DCP and DCP Linam Ranch had facility and/or equipment issues due to hydrates which prompted their HiLo valve to shut down and subsequent restrictions/constraints of their pipeline service operations. OXY routed its stranded gas to flare until DCP/Linam Ranch was able to resume normal working operations and begin taking gas again.                                                                                                                                                                                                                                                                                                                                                                             |
| Steps taken to limit the duration and magnitude of vent or flare                                                                 | It is OXY's policy to route its stranded gas to a flare during an unforeseen and unavoidable emergency or malfunction, as the part of the overall process or steps to take to limit duration and magnitude of flaring. Oxy personnel are in the field 24/7 and can physically see when we are flaring which in turn are communicated to additional Oxy field personnel. Internal OXY procedures ensure that upon notice of flaring, malfunction gas compressor unit and/or multiple unit shutdown alarms, increased sensor line pressure alarms, etc., field production technician personnel are promptly notified, and are instructed to assess the issue as soon as possible to take prompt corrective action and minimize emissions. Oxy production technicians must assess whether the issue or circumstance is due to damage and repair is needed, or whether there are other reasons for its cause. In this case, Oxy routed its stranded gas to flare, during both shut in episodes, until DCP was able to resume normal working service operations. In this case, because of the reduction in the gas intake volume from the DCP Linam Ranch gas plant, DCP's associating downstream facilities, then restricted their sales gas service system pipeline, also causing high discharge pressure to occur resulting in a constraint of the intake of gas from Oxy. This situation was out of OXY's control but OXY made every effort to control and minimize emissions as much as possible while DCP & DCP Linam Ranch was down and had restricted/constrained their gas service pipeline operations. All OXY compression equipment were running at maximized capacity with no issues until DCP and DCP Linam Ranch had facility and/or equipment issues due to hydrates which prompted their HiLo valve to shut down and subsequent restrictions/constraints of their pipeline service operations. OXY routed its stranded gas to flare until DCP/Linam Ranch was able to resume normal working operations and begin taking gas again. |
| Corrective actions taken to eliminate the cause and reoccurrence of vent or flare                                                | Oxy is limited in its corrective actions to eliminate the cause and potential reoccurrence of a DCP sales gas service system pipeline constraint/restriction or shut in, as this control issue is downstream of Oxy's custody transfer point and out of Oxy's control to avoid or prevent from happening or reoccurring. DCP's downstream facility issues will reoccur from time to time and may trigger a spike in their gas line pressure, which in turn, directly impacts Oxy's ability to send gas to them. When DCP's downstream facility and/or its associating downstream facilities has issues or greatly struggles to handle the volume of gas being sent to them by Oxy, DCP then restricts Oxy's ability to send gas, which then prompts Oxy to route its stranded gas not pushed into the DCP sales gas pipeline, to flare. OXY makes every effort to control and minimize emissions as much as possible. The limited reactive actions that Oxy can do in this circumstance is to shut in multiple high GOR wells to minimize gas throughput to match and reduce flaring volumes during this third-party pipeline operator gas service pipeline shut in as well as continually communicate with DCP personnel throughout these type of situations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
