UPSET FLARING EVENT SPECIFIC JUSTIFICATIONS FORM

Facility: Corral 2S CS Flare Date: 07/23/2022

Duration of event: 17 Hours 29 Minutes **MCF Flared:** 577

Start Time: 06:00 AM End Time: 11:29 PM

Cause: Numerous Sporadic Well Surges

Method of Flared Gas Measurement: Gas Flare Meter

Comments: This event consists of three separate episodes of flaring within a 24-hour period due to wells were sporadically surging off and on throughout most of day and night. Flaring episodes: (1) 06:00 AM to 12:00 PM @ 280 MCF, (2) 12:00 PM to 05:30 PM @ 100 MCF, (3) 06:00 PM to 11:29 PM @ 197 MCF.

1. Reason why this event was beyond Operator's control:

In this case, sales gas had to be flared rather than be compressed due to wells flowing to the facility began surging more gas than the compressors engines could handle, which in turn, triggered intermittent flaring to occur. There were three episodes of flaring within a 24-Hour period due to wells were sporadically surging on and off throughout most of the day and night. The first episode of intermittent flaring occurred approximately from 06:00 AM to 12:00 PM, the second episode approximately from 12:00 PM to 05:30 PM and the final episode from 06:00 PM to 11:59 PM. In the first episode of flaring, Oxy production techs Oxy production techs received flaring alarms and upon arrival to the facility began inspecting the equipment and finding no issues then checked the well monitor program, which indicated the wells were surging. Oxy production techs immediately began manually adjusting well pressure gas rates while another Oxy production tech began making arrangements with additional field personnel to choke back several wells at the well heads by adjusting the pressure control valves on the flow lines. The same process occurred during the second and third episodes of flaring. These instances of intermittent flaring are unforeseeable and unanticipated as wells surge from time to time, with no warning or slightest indication of such is to occur, which is out of OXY's control. OXY made every effort to control and minimize emissions as much as possible. Oxy production techs remained on-site and rotated when necessary throughout the day and night, even during shift change, to continually monitor the well program so that manual adjustments of the well pressure gas rates could be done whenever the well surges overloaded the facility's compression equipment.

2. Steps Taken to limit duration and magnitude of venting or flaring:

It is OXY's policy to route its stranded gas to a flare during an unforeseen and unavoidable emergency or malfunction, as the part of the overall process or steps to take to limit duration and magnitude of flaring. Oxy personnel are in the field 24/7 and can physically see when we are flaring which in turn are communicated to additional Oxy field personnel. Internal OXY procedures ensure that upon notice of flaring, malfunction gas compressor unit and/or multiple unit shutdown alarms, increased sensor line pressure alarms, etc., field production technician personnel are promptly notified, and are instructed to assess the issue as soon as possible to take prompt corrective action and minimize emissions. Oxy production technicians must assess whether the issue or circumstance is due to damage and repair is needed, or whether there are other reasons for its cause. In

this case, sales gas had to be flared rather than be compressed due to wells flowing to the facility began surging more gas than the compressors engines could handle, which in turn, triggered intermittent flaring to occur. There were three episodes of flaring within a 24-Hour period due to wells were sporadically surging on and off throughout most of the day and night. The first episode of intermittent flaring occurred approximately from 06:00 AM to 12:00 PM, the second episode approximately from 12:00 PM to 05:30 PM and the final episode from 06:00 PM to 11:59 PM. In the first episode of flaring, Oxy production techs Oxy production techs received flaring alarms and upon arrival to the facility began inspecting the equipment and finding no issues then checked the well monitor program, which indicated the wells were surging. Oxy production techs immediately began manually adjusting well pressure gas rates while another Oxy production tech began making arrangements with additional field personnel to choke back several wells at the well heads by adjusting the pressure control valves on the flow lines. The same process occurred during the second and third episodes of flaring. Oxy production techs remained on-site and rotated when necessary throughout the day and night, even during shift change, to continually monitor the well program so that manual adjustments of the well pressure gas rates could be done whenever the well surges overloaded the facility's compression equipment. Each instance of adjustment takes a bit of time to perform, and flaring instances occurred approximately ranging from 05 minutes to 15 minutes, dependent on the number of wells surging. These instances of intermittent flaring are unforeseeable and unanticipated as wells surge from time to time, with no warning or slightest indication of such is to occur, which is out of OXY's control. OXY made every effort to control and minimize emissions as much as possible.

3. Corrective Actions taken to eliminate the cause and reoccurrence of venting or flaring:

Oxy cannot take any corrective actions to eliminate the cause and potential reoccurrence of wells surging from time to time and overloading compression equipment. Well surges can occur at any moment, without warning, which is out of OXY's control. OXY makes every effort to control and minimize emissions as much as possible when well surges occur.

	Action Type: [C-129] Venting and/or Flaring (C-129)
QUESTIONS	•
Prerequisites	
Any messages presented in this section, will prevent submission of this application. Please resolve t	hese issues before continuing with the rest of the questions.
Incident Well	Not answered.
Incident Facility	[fAPP2126640958] CORRAL #2 SOUTH COMP STATION

Determination of Reporting Requirements		
Answer all questions that apply. The Reason(s) statements are calculated based on your answers ar	nd may provide addional guidance.	
Was this vent or flare caused by an emergency or malfunction	Yes	
Did this vent or flare last eight hours or more cumulatively within any 24-hour period from a single event	Yes	
Is this considered a submission for a vent or flare event	Yes, major venting and/or flaring of natural gas.	
An operator shall file a form C-141 instead of a form C-129 for a release that, includes liquid during venting and/or flaring that is or may be a major or minor release under 19.15.29.7 NMAC. Was there at least 50 MCF of natural gas vented and/or flared during this event Yes		
Did this vent or flare result in the release of ANY liquids (not fully and/or completely flared) that reached (or has a chance of reaching) the ground, a surface, a watercourse, or otherwise, with reasonable probability, endanger public health, the environment or fresh water	No	
Was the vent or flare within an incorporated municipal boundary or withing 300 feet from an occupied permanent residence, school, hospital, institution or church in existence	No	

Equipment Involved		
Primary Equipment Involved	Other (Specify)	
Additional details for Equipment Involved. Please specify	Emergency Flare > Numerous Sporadic Well Surges	

Representative Compositional Analysis of Vented or Flared Natural Gas		
Please provide the mole percent for the percentage questions in this group.		
Methane (CH4) percentage	78	
Nitrogen (N2) percentage, if greater than one percent	1	
Hydrogen Sulfide (H2S) PPM, rounded up	0	
Carbon Dioxide (C02) percentage, if greater than one percent	0	
Oxygen (02) percentage, if greater than one percent	0	
If you are venting and/or flaring because of Pipeline Specification, please provide the required specifications for each gas.		
Methane (CH4) percentage quality requirement	Not answered.	
Nitrogen (N2) percentage quality requirement	Not answered.	
Hydrogen Sufide (H2S) PPM quality requirement	Not answered.	
Carbon Dioxide (C02) percentage quality requirement	Not answered.	
Oxygen (02) percentage quality requirement	Not answered.

QUESTIONS

Date(s) and Time(s)		
Date vent or flare was discovered or commenced	07/23/2022	
Time vent or flare was discovered or commenced	06:00 AM	
Time vent or flare was terminated	11:29 PM	
Cumulative hours during this event	18	

Measured or Estimated Volume of Vented or Flared Natural Gas		
Natural Gas Vented (Mcf) Details	Not answered.	
Natural Gas Flared (Mcf) Details	Cause: Other Other (Specify) Natural Gas Flared Released: 577 Mcf Recovered: 0 Mcf Lost: 577 Mcf]	
Other Released Details	Not answered.	
Additional details for Measured or Estimated Volume(s). Please specify	Gas Flare Meter	
Is this a gas only submission (i.e. only significant Mcf values reported)	Yes, according to supplied volumes this appears to be a "gas only" report.	

Venting or Flaring Resulting from Downstream Activity		
Was this vent or flare a result of downstream activity	No	
Was notification of downstream activity received by this operator	Not answered.	
Downstream OGRID that should have notified this operator	Not answered.	
Date notified of downstream activity requiring this vent or flare	Not answered.	
Time notified of downstream activity requiring this vent or flare	Not answered.	

Steps and Actions to Prevent Waste			
For this event, this operator could not have reasonably anticipated the current event and it was beyond this operator's control.	True		
Please explain reason for why this event was beyond this operator's control	In this case, sales gas had to be flared rather than be compressed due to wells flowing to the facility began surging more gas than the compressors engines could handle, which in turn, triggered intermittent flaring to occur. There were three episodes of flaring within a 24-Hour period due to wells were sporadically surging on and off throughout most of the day and night. The first episode of intermittent flaring occurred approximately from 06:00 AM to 12:00 PM, the second episode approximately from 12:00 PM to 05:30 PM and the final episode from 06:00 PM to 11:59 PM. In the first episode of flaring, Oxy production techs Oxy production techs received flaring alarms and upon arrival to the facility began inspecting the equipment and finding no issues then checked the well monitor program, which indicated the wells were surging. Oxy production techs immediately began manually adjusting well pressure gas rates while another Oxy production tech began making arrangements with additional field personnel to choke back several wells at the well heads by adjusting the pressure control valves on the flow lines. The same process occurred during the second and third episodes of flaring. These instances of intermittent flaring are unforeseeable and unanticipated as wells surge from time to time, with no warning or slightest indication of such is to occur, which is out of OXY's control. OXY made every effort to control and minimize emissions as much as possible. Oxy production techs remained on-site and rotated when necessary throughout the day and night, even during shift change, to continually monitor the well program so that manual adjustments of the well pressure gas rates could be done whenever the well surges overloaded the facility's compression equipment.		
Steps taken to limit the duration and magnitude of vent or flare	It is OXY's policy to route its stranded gas to a flare during an unforeseen and unavoidable emergency or malfunction, as the part of the overall process or steps to take to limit duration and magnitude of flaring. Oxy personnel are in the field 24/7 and can physically see when we are flaring which in turn are communicated to additional Oxy field personnel. Internal OXY procedures ensure that upon notice of flaring, malfunction gas compressor unit and/or multiple unit shutdown alarms, increased sensor line pressure alarms, etc., field production technician personnel are promptly notified, and are instructed to assess the issue as soon as possible to take prompt corrective action and minimize emissions. Oxy production technicians must assess whether the issue or circumstance is due to damage and repair is needed, or whether there are other reasons for its cause. In this case, sales gas had to be flared rather than be compressed due to wells flowing to the facility began surging more gas than the compressors engines could handle, which in turn, triggered intermittent flaring to occur. There were three episodes of flaring within a 24-Hour period due to wells were sporadically surging on and off throughout most of the day and night. The first episode of intermittent flaring occurred approximately from 06:00 AM to 12:00 PM, the second episode approximately from 12:00 PM to 05:30 PM and the final episode from 06:00 PM to 11:59 PM. In the first episode of flaring, Oxy production techs Oxy production techs received flaring alarms and upon arrival to the facility began inspecting the equipment and finding no issues then checked the well monitor program, which indicated the wells were surging. Oxy production techs immediately began manually adjusting well pressure gas rates while another Oxy production tech began making arrangements with additional field personnel to choke back several wells at the well heads by adjusting the pressure control valves on the flow lines.		
Corrective actions taken to eliminate the cause and reoccurrence of vent or flare	Oxy cannot take any corrective actions to eliminate the cause and potential reoccurrence of wells surging from time to time and overloading compression equipment. Well surges can occur at any moment, without warning, which is out of OXY's control. OXY makes every effort to control and minimize emissions as much as possible when well surges occur.
