Subject: Closure Request for Tap Rock – Prometheus Frac Line (Closest Well: Jackson Unit #020H)

API NO. 30-025-41139

Incident No. NAPP2206666393

**Legal: U/L O, Section 21, Township 24 South, Range 33 East
Lea County, New Mexico**

To Whom it May Concern:

Tap Rock Operating, retained Energy Staffing Services, LLC (ESS) to conduct a spill assessment for the Prometheus Frac Line (hereafter referred to as the “Prometheus”) for the produced water release that occurred on March 7th, 2022. On same said date ESS provided the immediate notification of the release to the New Mexico Oil Conservation Division (NMOCD), District II Office, via email on March 7th at 3:29 PM (notification attached). On behalf of Tap Rock, ESS also submitted the initial C141 Release Notification, along with the spill calculator used to determine the volume of the release (attached) on March 7th, 2022. The NMOCD accepted the C141 as record on March 9th as well as email response from Mr. Bratcher accepting the release notification on March 7th. The incident number assigned to the release is NAPP22006666393. (Notification correspondence is attached)

This report provides a detailed description of the spill assessment, delineation, and remedial activities, which demonstrates that the closure criteria has been established in the 19.15.29.12 *New Mexico Administrative Code (NMAC: New Mexico Oil Conservation Division, 2018)* have been met and all applicable regulations have been followed. This document is intended to serve as the final report to obtain approval from the NMOCD for the closure of the above-mentioned release.

Incident Description

On March 7th, 2022, a truck driver for Nova Compression was turning around in the lease road and hit the lay flat frac line, causing it to rupture. The released fluid remained in the pasture area and did not enter the lease road. Once the release was reported, vac trucks were dispatched to the site, but by the time they arrived, the fluid had soaked in.

ESS was dispatched to the site and conducted an environmental site assessment of the release. It was determined after measuring the impacted area and depth of saturation, that approximately 183.64bbbls of produced water was release and no fluids were recovered. Initial site photos and measuring of the impacted area was conducted. Please see the initial site photos attached.

Site Characterization

The release at the Prometheus occurred on state land and is located at 32.195893 latitude and -103.576798 longitude, 23.02 miles northwest of Jal, New Mexico. The legal description of the site is Unit Letter O, Section 21, Township 24 South, and Range 33 East. This site is in Lea County, New Mexico. Please see site schematic attached.

The Prometheus consists of production lines and is near production facilities and well pads. The area of the release is in the pasture area which runs parallel to the lease road. The elevation of the release is 4844 ft. This area is historically or has been primarily dominated by black grama and other perennial forbs found in the Maljamar Loamy Sand and little bluestem, other shrubs, perennial forbs, sand bluestem and spike dropseed found in the Pyote Loamy Sand. Please see the attached Rangeland and Vegetation Classification information attached.

The *United States Department of Agriculture Natural Resources Conservation Services*, indicates that the soil type in the area of the Prometheus, consists of 100% Pyote and Majamar fine sands. (Soil Map Attached). In the area of the Prometheus the *FEMA National Flood Hazard Layer* indicates that there is 0.2% annual chance of a flood hazard with a 0.1% chance of a flood with an average of depth of one foot or with drainage areas of less than one square mile. (See map attached).

There is "low potential" for Karst Geology to be present near the Prometheus site, according to the *United States Department of the Interior, Bureau of Land Management*. Please find the Karst Map attached herein.

There is no surface water located near or around the Prometheus. The site is not near a continuously flowing watercourse and or lakebed within ½ a mile from the release. No other critical or community features were found at the Prometheus site. (Attached Watercourse Map)

The nearest and most recent water well to the site according to the *New Mexico Office of the State Engineer* is C04339 POD1, drilled in 2019 with the well depth of 47' but no depth to

groundwater located, distance of the well is 2392 yards from the site. The second known water well is the C04339 POD8, 2456 yards from the site, drilled in July of 2019, depth of well is 30' bgs but no viable groundwater information found. The third site is labelled C043399 POD7, 2520 yards from the site, drilled in July of 2019, depth of well is 43' bgs with no viable groundwater data. An extended groundwater search was conducted using the *OSE POD Location Mapping System* and it has been determined that, no other wells were found within a ½ a mile radius of the Prometheus release. Please find the NMOSE, OSE POD and groundwater map attached to this report.

Closure Criteria Determination

The Closure Criteria for Soils impacted by a Release is shown in the below chart. No groundwater data was found within a ½ a mile radius from the release point, being on State Land and with having a "low karst potential," the site fell under <50' to ground water. This is only due to not having any recent or available water depths.

DGW	Constituent	Method	Limit
≤ 50'	Chloride	EPA 300.0 OR SM4500 CLB	600 mg/kg
	TPH (GRO + DRO + MRO)	EPA SW-846 METHOD 8015M	100 mg/kg
	GRO + DRO	EPA SW-846 METHOD 8015M	50 mg/kg
	BTEX	EPA SW-846 METHOD 8021B OR 8260B	10 mg/kg
	Benzene	EPA SW-846 METHOD 8021B OR 8260B	10 mg/kg

Soil Remediation Action Levels

ESS has provided sufficient data that this release has impacted the soil at the Prometheus and that the protocol is consistent with the remediation/abatement goals and objectives set forth in the *NMOCD Closure Criteria for Soils Impacted by a Release, dated August 14, 2018*.

The guidance document provides direction for Tap Rock's initial response actions, site assessment and sample procedures conducted by ESS Staff. We would like to present to you the following information concerning the delineation process for the release detailed herein.

Soil Sampling Procedures

Soil sampling for laboratory analysis was conducted according to the NMOCD – approved industry standards. Accepted NMOCD soil sampling procedures and laboratory analytical methods are as follows:

- Collect clean samples in airtight glass jars supplied by the laboratory to conduct the analysis
- Each sample jar was labelled with site and sample information
- Samples were kept in and stored in a cool place and packed on ice

- Promptly ship sample to the lab for analysis following the chain of custody procedures

The following lab analysis method was used for each bottom hole (vertical) and sidewall sample (horizontal) was submitted to Envirotech Analytical Laboratory:

Volatile Organics by EPA 8021B

- Benzene, Toluene, Ethylbenzene, p.m. Xylene, o-Xylene and Total Xylenes

Nonhalogenated Organics by EPA 8015D – GRO

- Gasoline Range Organics (C6-C10)

Nonhalogenated Organics by EPA 8015D – DRO/ORO

- Diesel Range Organics (C10-C28)
- Oil Range Organics (C28-C40)

Anions by EPA 300.0/9056A

- Chloride

Release Investigation Data Evaluation

On March 14th of 2022, ESS arrived on the site, set the delineation sample points, GPS'd each sample point and began to obtain surface samples. Each surface sample was field tested, logged, then submitted to Envirotech Laboratory for confirmation. A total of 26 vertical sample points were placed along with 26 horizontal sample points. Each sample point was then sampled by use of hand auger and in 1' intervals. Bottom hole samples were then submitted to the lab for confirmation. Sample point 15 had slightly elevated chlorides at 648 at 2'bgs, further investigation was completed during the excavation process. Refusal on sample point 20-25 was encountered and would be sampled when the excavation process was completed. Please see the delineation sample data below, with lab data indicated in yellow. Attached to this report you will find the sample data, delineation sample map and lab analysis.

On behalf of Nova Compression, an extension was requested on May 23rd, due to waiting on insurance claims to be approved to continue the remediation. On same said date the extension was approved to August 8th. Please see email correspondence attached.

Excavation of the site began on May 31st, by use of backhoe and hydro-vac truck. All of the buried lines were spotted and exposed to 3' below and around the pipe. Depths of the excavation ranged from 2'bgs to 5'bgs across the impacted area. All of the contaminated soil was hauled to Owl disposal. A total of 2,268 cubic yards of contaminated soil was hauled and disposed of.

On June 9th, ESS crews began to conduct composite samples, using the 200 sq.ft. composite protocol. Please see the composite notification that was sent on June 6th attached to this report. A total of 106, 200 sq. ft. 5-point composites were obtained and field evaluated. In the areas of sample point 20-25 where refusal was obtained during delineation, the area was excavated to 4' and 5' respectively. The area was sampled as a composite placing the sample point as one of the five-point composites, sampled, and were confirmed by the laboratory under the concentration levels needed for this site. SP20 is composite 86, SP21 is composite 90, SP22 is composite 94, SP23 is composite 98, SP24 is composite 101 and SP25 is composite 103. Please find the composite sample map, GPS information, composite sample data and lab analysis attached to this report. The composite map is separated into sections for better viewing due to the length of the impacted area. Also please find the confirmed composite sampling below:

A total 2,134 cubic yards of topsoil was hauled in from NM10 Pit and 64 cubic yards of caliche from Owl Disposal and was stockpiled on an adjacent well pad that belongs to Tap Rock. Backhauling took place from June 6th thru June 13th.

Another extension request was submitted on August 4th. Due to unforeseen issues with Nova Compression and their cooperation concerning the insurance claim issues from their insurance carrier, ESS and Tap Rock were at a standstill. On August 5th, the extension was granted, please see email attached. At this time crews began to backfill the site. Site was backfilled with clean fresh topsoil and contoured back to its natural state. Please see final site photos attached to this report.

Closure Request

On behalf of Tap Rock, ESS request that the incident (NAPP2206666393), be closed for the release that occurred in the pasture area for the Prometheus Frac Line. Tap Rock and ESS certifies that all of the information provided and that is detailed in this report, is true and correct. We have also complied with all of the applicable closure requirements for the release that occurred on the Prometheus Frac Line.

After review of this report if you have any questions or concerns, please do not hesitate to contact the undersigned at (575) 390-6397 or (575) 393-9048. You may also email any issues to natalie@energystaffingllc.com.

Cause of Release

A truck driver for Nova Construction was turning around and hit the line, causing it to puncture. Based on field staff observations, site measurements and the site assessment conducted, it is believed to have released 183.64bbls of water, 50% fresh water and 50% recycled water. A vacuum truck was dispatched out but upon arrival, the fluid had soaked into the sand, therefore no fluid was recovered. This release was found in the pasture near the lease road. The water transfer line belongs to Breakwater, but Nova Construction will be responsible for the remediation of the release.

Initial Response

The responsible party must undertake the following actions immediately unless they could create a safety hazard that would result in injury

- The source of the release has been stopped.
- The impacted area has been secured to protect human health and the environment.
- Released materials have been contained via the use of berms or dikes, absorbent pads, or other containment devices.

Rangeland and Forest Vegetation Classification, Productivity, and Plant Composition

In areas that have similar climate and topography, differences in the kind and amount of rangeland or forest understory vegetation are closely related to the kind of soil. Effective management is based on the relationship between the soils and vegetation and water.

This table shows, for each soil that supports vegetation, the ecological site, plant association, or habitat type; the total annual production of vegetation in favorable, normal, and unfavorable years; the characteristic vegetation; and the average percentage of each species. An explanation of the column headings in the table follows.

An *ecological site, plant association, or habitat type* is the product of all the environmental factors responsible for its development. It has characteristic soils that have developed over time throughout the soil development process; a characteristic hydrology, particularly infiltration and runoff that has developed over time; and a characteristic plant community (kind and amount of vegetation). The hydrology of the site is influenced by development of the soil and plant community. The vegetation, soils, and hydrology are all interrelated. Each is influenced by the others and influences the development of the others. The plant community on an ecological site, plant association, or habitat type is typified by an association of species that differs from that of other ecological sites, plant associations, or habitat types in the kind and/or proportion of species or in total production. Descriptions of ecological sites are provided in the Field Office Technical Guide, which is available in local offices of the Natural Resources Conservation Service (NRCS). Descriptions of plant associations or habitat types are available from local U.S. Forest Service offices.

Total dry-weight production is the amount of vegetation that can be expected to grow annually in a well managed area that is supporting the potential natural plant community. It includes all vegetation, whether or not it is palatable to grazing animals. It includes the current year's growth of leaves, twigs, and fruits of woody plants. It does not include the increase in stem diameter of trees and shrubs. It is expressed in pounds per acre of air-dry vegetation for favorable, normal, and unfavorable years. In a favorable year, the amount and distribution of precipitation and the temperatures make growing conditions substantially better than average. In a normal year, growing conditions are about average. In an unfavorable year, growing conditions are well below average, generally because of low available soil moisture. Yields are adjusted to a common percent of air-dry moisture content.

Characteristic vegetation (the grasses, forbs, shrubs, and understory trees that make up most of the potential natural plant community on each soil) is listed by common name. Under *rangeland composition and forest understory*, the expected percentage of the total annual production is given for each species making up the characteristic vegetation. The percentages are by dry weight for rangeland. Percentages for forest understory are by either dry weight or canopy cover. The amount that can be used as forage depends on the kinds of grazing animals and on the grazing season.

Range management requires knowledge of the kinds of soil and of the potential natural plant community. It also requires an evaluation of the present range similarity index and rangeland trend. Range similarity index is determined by comparing the present plant community with the potential natural plant community on a particular rangeland ecological site. The more closely the existing community resembles the potential community, the higher the range similarity index. Rangeland trend is defined as the direction of change in an existing plant community relative to the potential natural plant community. Further information about the range similarity index and rangeland trend is available in the "National Range and Pasture Handbook," which is available in local offices of NRCS or on the Internet.

The objective in range management is to control grazing so that the plants growing on a site are about the same in kind and amount as the potential natural plant community for that site. Such management generally results in the optimum production of vegetation, control of undesirable brush species, conservation of water, and control of erosion. Sometimes, however, an area with a range similarity index somewhat below the potential meets grazing needs, provides wildlife habitat, and protects soil and water resources.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:20,000.

Warning: Soil Map may not be valid at this scale.
Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Lea County, New Mexico
Survey Area Data: Version 18, Sep 10, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 7, 2020—May 12, 2020

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

All,

On March 7th, Tap Rock reported a release at the above referenced location. This release was caused by a third party. ESS has been contracted to remediate this release. The site has been fully delineated. We have been waiting on Nova Constructions Insurance claim to be approved. This remediation is scheduled to begin next week. At this time, we would like to request an extension as this is a large release and will not be completed by the deadline of 6/7/22. Below you will find the information of the release:

Importance: High

Mike,

As per our conversation today, Taprock and ESS would like to request a 30-day extension for the Prometheus Frac Line release that occurred on 03/07/22 (NAPP220666393). With the issues discussed concerning Nova Compression (company who caused the release) and their insurance company, we cannot make the deadline of August 8th. ESS has fully delineated, excavated, conducted composite sampling, and have hauled in the backfill to a near by location, the only item left is to backfill the excavation.

Thank you for your consideration in this matter.

- Laboratory data including chain of custody

If the site characterization report does not include completed efforts at remediation of the release, the report must include a proposed remediation plan. That plan must include the estimated volume of material to be remediated, the proposed remediation technique, proposed sampling plan and methods, anticipated timelines for beginning and completing the remediation. The closure criteria for a release are contained in Table 1 of 19.15.29.12 NMAC, however, use of the table is modified by site- and release-specific parameters.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to OCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the OCD does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to groundwater, surface water, human health or the environment. In addition, OCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations. The responsible party acknowledges they must substantially restore, reclaim, and re-vegetate the impacted surface area to the conditions that existed prior to the release or their final land use in accordance with 19.15.29.13 NMAC including notification to the OCD when reclamation and re-vegetation are complete.
