SUBJECT: Transmittal of 2021 Annual Groundwater Monitoring Report

Targa Midstream Services LLC

Eunice Gas Plant, Eunice, Lea County, New Mexico

Dear Mr. Billings:

Targa Midstream Services LLC (Targa) is submitting the enclosed 2021 Annual Groundwater Monitoring Report for the Eunice Gas Plant in Lea County, New Mexico.

Please do not hesitate to contact me at (713) 584-1396 or <u>chigginbotham@targaresources.com</u> if you have any questions regarding this submittal.

Sincerely,

Christina M. Higginbotham, P.G. (Texas) Senior Environmental Specialist

semer Environmental special

**Enclosures** 

Review of the 2021 Annual
Groundwater Monitoring Report for

Targa Midstream Eunice Gas Plant Site:

#### Content Satisfactory

- 1. Continue to conduct groundwater monitoring as prescribed by NMOCD.
- Considerations for high chloride impact to monitoring wells may need to be analyzed for a remediation technology treatment such as ion exchange or reverse osmosis.
- 3. Please continue to submit annual groundwater monitoring reports for 2022, and 2023 by April 1, 2024.
- Continue investigation of LNAPL source as necessary.

# 2021 Annual Groundwater Monitoring Report

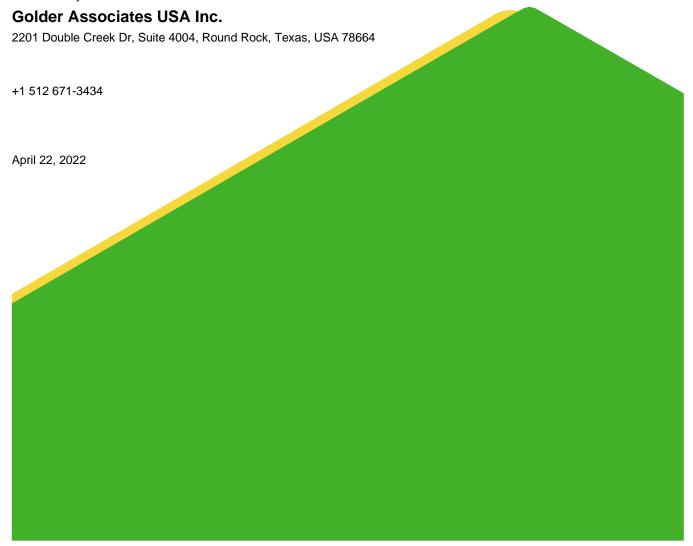

Targa Midstream Services LLC Eunice Gas Plant 25 Middle Plant Lane Eunice, New Mexico

#### **EXECUTIVE SUMMARY**

Golder Associates USA Inc. (Golder), a member of WSP, was retained by Targa Midstream Services LLC (Targa) to conduct annual groundwater monitoring in October 2021 at the Targa Eunice Gas Plant (Facility) located in Eunice, New Mexico. The Eunice Gas Plant is located in Section 3, Township 22 South, Range 37 East, Lea County, New Mexico at geographic coordinates 32° 25′ 29.3″ N, 103° 08′ 50.1″ W (Site).

On October 25, 2021, Golder conducted a synoptic gauging event that included measurement of static fluid levels and total depths of the 53 Site monitoring wells. Prior to this event, Golder repaired and redeveloped monitoring well MW-5; a well that was not sampled in August 2020 due to damaged casing. During the October 2021 sampling event, Golder discovered a deflection in the well casing of MW-28 that precluded sampling of the well with equipment available at the time. On October 25-26, 2021, groundwater samples were collected using low-flow techniques from monitoring wells MW-1, MW-5, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-30 and MW-31. All samples were analyzed for chloride and samples from MW-6, MW-14, MW-18, MW-19 and MW-23 were additionally analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX) as agreed to in the February 2018 meeting between Targa and New Mexico Oil Conservation Division (OCD).

Light non-aqueous phase liquid (LNAPL) was recorded at a measurable thickness in 19 wells (MW-2A, MW-3, MW-22, MW-27, MW-32 through MW-35, MW-37, MW-38, RW-1, VW-1 through VW-4, HVR-1 and HV-1, HV-2 and HV-4) this reporting period. Although average apparent LNAPL thickness measured in wells decreased from 3.97 feet in August 2020 to 3.80 feet in October 2021, thicknesses generally decreased in the area extending from MW-37 to VW-4 (western portion of the product plume) but increased in the vicinity of MW-3. The changes in LNAPL thickness reflect either rising (reduced LNAPL thickness) or falling groundwater levels (increased LNAPL thickness) under unconfined conditions. However, a notable increase in LNAPL thickness was recorded at VW-1 in October 2021 in response to rising groundwater levels. The LNAPL plume receded in the east with no measurable product present in HV-3, HV-5 through HV-9 and MW-29 (near the eastern lateral extent of the groundwater bearing unit).

Groundwater data collected in October 2021 were generally consistent (within seasonal variability) with results from August 2020. Benzene was detected at a solitary location (MW-18) at a concentration exceeding the applicable New Mexico Water Quality Control Commission (WQCC) human health standard of 0.010 milligrams per liter (mg/L). Although benzene was reported at 0.0638 mg/L in MW-18, which is located distal/downgradient of the LNAPL plume, benzene was not detected in the sample collected from MW-23 located approximately 130 feet southeast and hydraulically downgradient of the leading edge of the product plume. Total xylenes were detected at a maximum concentration of an estimated 0.000411 mg/L (MW-14) which is below the WQCC standard of 0.62 mg/L. Toluene and ethylbenzene were not detected above the method quantitation limit of 0.001 mg/L.

Chloride was detected at concentrations exceeding the WQCC domestic water supply standard of 250 mg/L in samples collected from all wells sampled in October 2021, except for MW-5. Chloride was detected at 374 mg/L, slightly exceeding the standard in MW-23, located immediately downgradient of the LNAPL plume. Elevated chloride concentrations were reported in MW-13 (5,730 mg/L), MW-14 (13,900 mg/L), MW-18 (17,200 mg/L), MW-19 (7,060 mg/L) and MW-30 (10,000 mg/L) located distal and downgradient of the Facility. Monitoring wells MW-14 and MW-18 are in the vicinity of historic brine storage ponds associated with cavern storage operations.

April 22, 2022

Golder recommends that the next groundwater monitoring event be performed in the first quarter of 2022 to meet OCD's request of completing annual sampling on a progressively subsequent quarter schedule along with continued investigation of the LNAPL source. Further, we recommend sampling of MW-28 with a smaller diameter submersible pump (that is not obstructed by the well casing deflection) in future events.

APPENDIX A Laboratory Analytical Reports

#### 1.0 INTRODUCTION

Golder Associates USA Inc. (Golder), a member of WSP, has prepared this report on behalf of Targa Midstream Services LLC (Targa) to document annual groundwater monitoring activities conducted in October 2021 at the Targa Eunice Gas Plant (Facility) located in Eunice, New Mexico.

The Eunice Gas Plant is in Section 3, Township 22 South, Range 37 East, Lea County, New Mexico at geographic coordinates 32° 25' 29.3" N, 103° 08' 50.1" W (Site) as shown in the Site Location Map included as **Figure 1**.

Targa has performed select subsurface investigations on and off Site to date that has included the installation of numerous soil borings and monitoring wells. The investigations along with light non-aqueous phase liquid (LNAPL) fingerprinting and daylighting/exposure of underground piping and appurtenances has not identified a specific source of the condensate plume located in the southeast portion of the Facility.

### 1.1 Background

The Facility historically operated under New Mexico Oil Conservation Division (OCD) Water Quality Control Commission (WQCC) Discharge Permit GW-005. However, this permit was rescinded upon Targa's affirmation that operations at the Facility did not intentionally result in discharge of contaminants to the ground surface, subsurface or to groundwater.

As part of an investigation of alleged discharge of chromium bearing wastewater east of the Facility in 2002, the former operator of the Facility, Dynegy Midstream Services, LP, (acquired by Targa in November 2005), installed twenty-one monitoring wells (MW-1 through MW-21 from April 2002 through November 2005). Further, Chevron USA (Chevron) installed two monitoring wells (MW-UN-1 and MW-UN-2) south of the Facility to assess a release from a drilling pit associated with the Mark #13 well (API 30-025-37385). OCD issued an abatement permit (AP-081) for the Chevron release.

In July 2008, Targa decommissioned a tank battery (Shell tanks) located in the southeast corner of the Facility. The Shell tanks included one 500-barrel (bbl) gun barrel tank, two 500-bbl condensate tanks and an oil/water separator. Former Shell Tanks Excavation Report and Closure Approval Request prepared by Larson & Associates, Inc. (Larson) dated June 7, 2010 documented excavation (125 feet long, 75 feet wide and 6-8 feet deep) and offsite disposal of approximately 2,028 cubic yards of petroleum impacted soil. Confirmation sampling indicated that total petroleum hydrocarbons (TPH), at concentrations up to 1,652 milligrams per kilogram (mg/kg) (sample East Wall-SS4), remained in place along the eastern extent of the excavation adjacent to monitoring well MW-3 exceeding the cleanup goal of 1,000 mg/kg. Further, TPH was reported at 3,704 mg/kg in a soil sample collected at 18-19.5 feet below ground surface (bgs) and 1,084 mg/kg in a sample collected at 23-24.5 feet bgs from a boring installed in the center of the excavation. Targa replaced the Shell tanks, relocating the tank battery approximately 200 feet north of the original location. The new (current) tank battery includes two 500-bbl condensate tanks and one 500-bbl gun barrel tank (oil/water separation).

On July 29, 2008, while the Shell tank excavation remained open, approximately 20 bbl of condensate was released from a dresser sleeve failure near the closed drain scrubber (adjacent to the current tank battery). The July 2008 Dresser Sleeve Release resulted from over pressurization of a dump line during pigging operations and liquid flowed into the Shell tank excavation. Targa reportedly recovered 20-bbl of the condensate released using a vacuum truck.

LNAPL, visually consistent with natural gas condensate, was initially discovered at the Site in monitoring well MW-3 (apparent thickness of 5.15 feet) adjacent to the former Shell tanks located in the southeast portion of the Facility on October 12, 2009. The discovery occurred while conducting routine groundwater monitoring associated with Facility discharge permit GW-005. Targa evaluated the source of the product in MW-3 by collecting a sample from this well and three potential Facility sources (XTO inlet scrubber, closed drain scrubber and condensate from the Shell tanks) in October and November 2009. Samples were analyzed for API gravity, sulfur, and extended hydrocarbons. As the sample collected from the XTO inlet scrubber only contained trace phase separated hydrocarbons (PSH), fingerprint analysis of this sample was not possible. Biomarkers pristane and phytane were reported in the closed drain scrubber sample but not in the samples collected from MW-3 or the Shell tanks. Biomarker farnesane was not detected in the Shell tanks sample but was reported in MW-3 and the closed drain scrubber sample. Based on the fingerprint analysis, it was concluded that the product samples were not from the same source and the closed drain scrubber was not considered the source of the hydrocarbon in MW-3. Short-term pressure testing of underground lines in the vicinity of MW-3 (including the closed drain scrubber, north and south vapor recovery unit (VRU) sales tanks, three-phase separator, west and east inlet scrubbers, new condensate and gun barrel tanks, sump, and lease automatic custody transfer (LACT) for sales lines) failed to identify a leak and the source of the product discovered in MW-3.

Targa installed a pneumatic product recovery system in MW-3 and recovered approximately 236 gallons of condensate between November 19, 2009 and July 12, 2010. At the request of OCD, Targa installed monitoring well MW-22 upgradient of MW-3 (and MW-23 downgradient of MW-3) on March 8-9, 2010. Upon discovery of LNAPL in MW-22, a pneumatic pump was installed in this well and product recovery initiated on June 6, 2010. Approximately 2,060 gallons of condensate was recovered from MW-22 from July 28, 2010 through November 1, 2010. Monitoring wells MW-24 through MW-26 were subsequently installed upgradient of MW-3 and MW-22 in May 2010 to further delineate the LNAPL plume. Petroleum hydrocarbon impact to the vadose zone was not reported in soil samples collected during drilling of borings in which these wells were installed and LNAPL was not present at a measurable thickness in contact with groundwater.

On October 13, 2010, Targa exposed underground flow lines, fittings, and valves approximately 40 feet west of the current condensate tank battery and 60 feet north of MW-22 and discovered soil saturated with hydrocarbon that was associated with a leaking union on a 2-inch dump line buried approximately 4 feet bgs.

Targa installed three monitoring wells (MW-27 through MW-29) downgradient and cross gradient of MW-3 and MW-22 along with recovery well (RW-1) and four vent wells (VW-1 through VW-4) near the suspected source of the LNAPL plume in February 2011. Monitoring well MW-29 was installed near the eastern lateral extent of the groundwater bearing unit where the groundwater level was close to the Ogallala and underlying shale confining unit contact. A pneumatic recovery pump installed in MW-27 recovered 1,311 gallons of product between March 2011 and March 2012. In July 2011, Larson recovered approximately 58 gallons of product from RW-1 during a pump test.

In 2012, Targa retained Southwest Geoscience to conduct LNAPL recovery using high vacuum extraction (HVE) techniques. Nine two-inch vacuum extraction wells (HV-1 through HV-9) and a 6-inch vacuum extraction well (HVR-1) were installed. Approximately 2,300 gallons of LNAPL (600 gallons liquid phase and 1,700 gallons vapor phase) was recovered by HVE techniques from wells HV-1, HV-2, HV-5, HV-7, HVR-1, MW-27, VW-1 and VW-4 from September 27, 2012 through November 7, 2012. In comparison, approximately 5,658 gallons of product were recovered by pneumatic skimmer from October 2009 to September 2012.

Monitoring well MW-30 was installed southeast of the Facility in April 2015 to delineate the extent of benzene in groundwater. The well is located on State of New Mexico land administered by the State Land Office. Monitoring well MW-31 was installed southeast of MW-30 to better delineate the downgradient extent of chloride and TDS in groundwater. Targa installed two soil borings on August 4-5, 2015 near the condensate tanks (SB-1) to further evaluate the LNAPL plume and west of MW-2A (SB-2) to assess LNAPL present in MW-2A. No elevated PID measurements were recorded in soil samples collected from SB-2 and no LNAPL was observed in contact with groundwater. Because elevated PID measurements were recorded at a depth of 25 feet bgs and 2.13 feet of LNAPL was measured in SB-1, the boring was completed as permanent monitoring well MW-32. Monitoring wells MW-33 through MW-38 were subsequently installed in November 2015 to better define and characterize the LNAPL plume in the southeast portion of the Facility.

As documented in 2016 Groundwater Monitoring Report prepared by Larson, dated November 20, 2017, bail down tests were conducted on December 7-8, 2016 to measure LNAPL recovery in eight wells (MW-3, MW-22, MW-32, MW-34, MW-37, RW-1, VW-2 and HVR-1). Larson reported the fastest LNAPL recharge rates in MW-22 and RW-1 and suggested that these wells may be proximate to the LNAPL source. Other wells, such as MW-34, exhibited slow recharge despite having similar or greater initial LNAPL thickness. Samples of product collected from wells MW-3, MW-22, MW-34, MW-35, MW-37, VW-2, VW-4, HV-4, HVR-1 and RW-1 and from potential Facility sources (east inlet scrubber, condensate tanks and VRU) were analyzed for select metals (vanadium, nickel and iron) by ASTM Method D5708 and hydrocarbons by ASTM Method D6730. Analysis indicated that the samples from the VRU and condensate tanks lacked detectable concentrations of heavier range (C15+) hydrocarbons that were reported in the east inlet scrubber. Furthermore, the east inlet scrubber sample had an elevated iron concentration (217 parts per million (ppm)) compared to the condensate tanks (2.30 ppm) or VRU (1.24 ppm) samples. As the samples collected from the wells contained detectable quantities of heavier hydrocarbons and iron concentrations in VW-2 (12.1 ppm), MW-22 (19.5 ppm) and RW-1 (88.6 ppm) were significantly above background, Targa investigated conditions around underground lines at the east inlet scrubber. However, excavation failed to identify any leaking lines suggesting that the east inlet scrubber was not the source of the LNAPL plume.

As documented in 2017 Groundwater Monitoring Report prepared by Larson, dated April 24, 2018, Targa conducted further exploratory investigation to identify leaking subsurface lines that may be contributing to the LNAPL plume. Hydrovac excavation completed to expose shallow underground pipelines near the three-phase separator and condensate tanks identified two leaking dresser sleeves on a 60-foot section of pipeline that was replaced immediately west of the condensate tanks. However, no significant source of the LNAPL plume was identified. The line from the water leg of the three-phase separator to the sump was replaced in mid-February 2018. The location of the hydro excavation trenches and potholes are shown on **Figure 4**.

The 2018 Groundwater Monitoring Report prepared by Larson, dated March 11, 2019 documented the following conditions at the Site:

- Groundwater flow direction remained consistent with flow towards the southeast under a gradient of approximately 0.008 ft./ft.;
- LNAPL (condensate) was observed in 20 wells during 2018. Based on the LNAPL measurements in 2018, LNAPL thickness increased in fourteen wells including MW-22, MW-32, MW-33, MW-34, MW-35, MW-37, MW-38, RW-1, VW-2, VW-3, VW-4, HVR-1, HV-2, and HV-4 and decreased in MW-2A. LNAPL thickness in remaining wells, including HV-1, HV-3, HV-5, MW-3 and VW-1, remained steady;

- Benzene exceeded the WQCC human health standard of 0.010 milligrams per liter (mg/L) in groundwater samples from MW-6 (0.0253 mg/L), MW-14 (0.0453 mg/L) and MW-18 (0.238 mg/L) during the annual monitoring event;
- Chloride exceeded the WQCC domestic water quality standard of 250 mg/L in groundwater samples from 12 monitoring wells during the June 15, 2018 monitoring event, with the highest concentrations reported in monitoring wells MW-14 (29,000 mg/L) and MW-18 (23,900 mg/L) located southeast of the Facility where historic brine ponds operated in conjunction with cavern wells; and
- Ethylbenzene, toluene, and xylenes were reported below the WQCC human health standards of 0.75 mg/L, 0.75 mg/L, and 0.62 mg/L, respectively, and in all samples.

In a meeting between Targa and OCD on February 22, 2018, OCD agreed that Targa could reduce the groundwater monitoring frequency to annually and limit sampling to fourteen wells (MW-1, MW-5, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-28, MW-30 and MW-31). Further, OCD agreed to reducing groundwater sample analysis to chloride for all fourteen wells and benzene, toluene, ethylbenzene and xylenes (BTEX) for wells MW-6, MW-14, MW-18, MW-19, and MW-23. While OCD agreed to discontinuing analysis of groundwater samples for RCRA metals, cations, anions and total dissolved solids (TDS), OCD noted that resumption of TDS analysis may be requested in the future. OCD concurred that chloride had been sufficiently delineated to the southeast/downgradient of the Facility and agreed that remediation may be suspended until the source of the LNAPL plume was identified. It was also agreed that LNAPL gauging frequency be reduced.

In April 2019 Targa retained Golder to perform annual groundwater monitoring activities at the Facility. A synoptic gauging event performed on April 1, 2019 included measurement of static fluid levels and total depths of the 53 Site monitoring wells. On April 4-8, 2019, groundwater samples were collected using low-flow techniques from monitoring wells MW-1, MW-5, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-28, MW-30 and MW-31. All samples were analyzed for chloride and BTEX constituents to verify the groundwater quality previously reported by Larson, since sampling through 2018 had been performed using pump/bailer techniques.

On July 29, 2019, Golder performed a focused LNAPL gauging event that included those wells located in the southeastern portion of the Facility. LNAPL was recorded at a measurable thickness in 23 wells (MW-2A, MW-3, MW-22, MW-29, MW-32 through MW-35, MW-37 through MW-38, RW-1, VW-1 through VW-4, HVR-1, HV-1 through HV-5, HV-7 and HV-9) in gauging events completed in 2019. The average LNAPL thickness increased from 2.99 feet in April 2019 to 3.61 feet in July 2019. Diagnostic gauge plots demonstrated that LNAPL existed under unconfined conditions and, therefore, the increased LNAPL thickness reflected a response to falling groundwater levels. However, LNAPL thickness measured in July 2019 at MW-29, VW-1, HVR-1, HV-3, HV-4, HV-7 and HV-9, wells generally located east of the Facility and the eastern extent of the LNAPL plume, receded with no measurable product present in MW-29, HV-7 and HV-9 (near the eastern lateral extent of the groundwater bearing unit).

Groundwater data collected by Golder in 2019 was generally consistent (within seasonal variability) with results obtained by Larson in June 2018. Benzene in groundwater concentrations exceeded the applicable WQCC human health standard of 0.010 mg/L in samples collected from MW-6, MW-18 and MW-28 in April 2019. Benzene was detected at a maximum concentration of 1.3 mg/L in MW-28, a well located approximately 130 feet southeast and hydraulically downgradient of the core of the product plume where apparent LNAPL thickness

exceeded 5 feet. Toluene, ethylbenzene and total xylenes were detected at maximum concentrations of an estimated 0.0008 mg/L, 0.470 mg/L and 0.053 mg/L, respectively in MW-28; concentrations that do not exceed the applicable WQCC standards of 0.75 mg/L, 0.75 mg/L and 0.62 mg/L, respectively.

Chloride was detected at concentrations exceeding the domestic water supply standard of 250 mg/L in all wells sampled in April 2019 except for MW-5, MW-23 and MW-28. Since monitoring wells MW-23 and MW-28 were not impacted by chloride and are located immediately downgradient of the LNAPL plume, the chloride impact to groundwater did not appear to be associated with the LNAPL plume release. Elevated chloride concentrations were reported in MW-14 (13,100 mg/L), MW-18 (24,600 mg/L), MW-19 (8,260 mg/L) and MW-30 (4,480 mg/L) located distal and downgradient of the Facility. MW-14 and MW-18 are located in the vicinity of historic brine storage ponds associated with cavern storage operations.

Golder conducted the 2020 annual groundwater monitoring event in the third quarter of the year to meet OCD's request of annual sampling on a progressively subsequent quarter schedule. LNAPL was recorded at a measurable thickness in 21 wells (MW-2A, MW-3, MW-22, MW-27, MW-29, MW-32 through MW-35, MW-37, MW-38, RW-1, VW-1 through VW-4, HVR-1 and HV-1 through HV-4). The average LNAPL thickness increased from 3.61 feet in July 2019 to 3.97 feet in August 2020. The LNAPL plume receded in the east with no measurable product present in HV-5 through HV-9 and only a minimal thickness of 0.01 foot (ft.) measured in MW-29 (near the eastern lateral extent of the groundwater bearing unit).

Samples were collected August 18-19, 2020 from monitoring wells MW-1, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-28, MW-30 and MW-31. Monitoring well MW-5 was damaged and was not sampled. Groundwater data collected in August 2020 were generally consistent (within seasonal variability) with data collected by Golder in July 2019. Benzene concentrations exceeded the WQCC human health standard of 0.010 mg/L in samples collected from MW-18 and MW-28. Benzene was detected at a maximum concentration of 1.38 mg/L in MW-28, a well located approximately 130 feet southeast and hydraulically downgradient of the core of the free product plume where apparent LNAPL thickness exceeded 6 feet. Ethylbenzene and total xylenes were detected at low concentrations below the applicable WQCC standards while toluene was not detected above the method quantitation limit. The downgradient extent of the dissolved phase petroleum hydrocarbon plume was defined by MW-23, located approximately 250 feet downgradient of MW-28, where benzene was reported at 0.00663 mg/L. Chloride was detected at concentrations exceeding the WQCC domestic water supply standard of 250 mg/L in all wells sampled in August 2020 except for MW-23 and MW-28. Since monitoring wells MW-23 and MW-28 were not impacted by chloride and are located immediately downgradient of the LNAPL plume, chloride impact to groundwater did not appear to be associated with the LNAPL plume release. Elevated chloride concentrations were reported in MW-13 (6,120 mg/L), MW-14 (15,900 mg/L), MW-18 (14,600 mg/L), MW-19 (8,780 mg/L) and MW-30 (7,790 mg/L) located distal and downgradient of the Facility. MW-14 and MW-18 are reportedly located in the vicinity of historic brine storage ponds associated with cavern storage operations.

### 1.2 Physical Setting

#### 1.2.1 Topography

The Facility topography grades toward the southeast with elevations ranging from approximately 3,430 feet above mean sea level (MSL) in the northwest to 3,380 feet MSL in the southeast. Surface runoff is routed to an area near the southeast corner of the Facility. No surface water bodies are located on the Facility. Monument Draw, the closest ephemeral body, is located about 1.5 miles east as shown on **Figure 1**.

#### 1.2.2 Geology

According to *Geologic Atlas of Texas, Hobbs Sheet* (Barnes, V.E et al, University of Texas, Bureau of Economic Geology, 1976), the Facility is underlain by Holocene-age windblown sand (Qsu) that is characterized as sand and silt in sheets and is light brown to reddish in color. The Pliocene-aged Ogallala Formation (To) underlies the windblown sand. The Ogallala is a fluviatile sand, silt, clay and gravel capped by caliche. The sand is fine to medium-grained quartz, in part silty and calcareous with common clay balls. The upper part of the Ogallala Formation is clayey, indistinctly bedded to massive, cross-bedded, unconsolidated to weakly cohesive with local quartzite lenses and colored various shades of grey and red. Silt and clay components are characterized as containing caliche nodules, reddish brown and dusky red and pink in color. Gravel is not always present, but consists mostly of quartz, some quartzite, sandstone, limestone, chert, igneous and metamorphic rock and worn *Gryphaea* in intraformational channel deposits and basal conglomerate. The caliche is sandy, pisolitic at the top and hard. The maximum thickness of the Ogallala is 100 feet. The upper Triassic-aged Chinle Formation is up to 300 feet thick and underlies the Ogallala Formation. The Chinle Formation is characterized as micaceous claystone, greenish and red in color with reduction spots and is interbedded with thinly bedded, fine-grained sandstone.

Larson characterized the Site geology based on boring logs as unconsolidated eolian sand overlying an eight- to 20-foot-thick carbonate-indurated sand (caliche) which in turn overlies a fine-grained pink quartz sand that is locally represented by sandstone. Clayey sand or red-bed clay is encountered ranging from approximately 24 feet bgs to 50 feet bgs in the east and center of the Facility, respectively.

#### 1.2.3 Groundwater

Groundwater at the Site occurs in the Ogallala Formation. The regional flow has historically been reported to be generally toward the southeast.

Records of the New Mexico State Engineer identify a fresh water well about 0.7 miles south (cross gradient) of the Facility. The well is in Unit O (SW/4, SE/4), Section 3, Township 22 South, Range 6, 37 East. A water level of 32.58 feet bgs was reported in this well on January 27,1976.

#### 2.0 GROUNDWATER MONITORING

## 2.1 Fluid Level Gauging and Potentiometric Surface Elevation

On October 25, 2021, Golder conducted a synoptic gauging event that included measurement of static fluid levels (depth to LNAPL and groundwater) and total depths of the 53 Site monitoring wells. Golder repaired the casing of monitoring well MW-5 (October 5, 2021) and redeveloped the well prior to this gauging event. Well caps were removed, and fluid levels allowed to equilibrate prior to gauging to the nearest one hundredth of one foot (0.01 ft.) from the top of well casing (TOC) with an oil/water interface probe. Cumulative fluid gauging data along with monitoring well completion data is summarized in **Table 1**. Groundwater elevations are corrected for the presence of LNAPL based on a specific gravity of 0.70, where appropriate.

Depth to groundwater ranged from 57.89 feet bgs at MW-8 located near the northwest corner of the Facility (topographically high) to 21.59 feet bgs at MW-4 located southeast of the Facility. Groundwater elevations ranged from 3,371.52 feet MSL at VW-1 to 3,316.12 feet MSL at MW-31. A Groundwater Gradient Map included as **Figure 3** was developed from the groundwater elevation data measured on October 25, 2021. Based on the potentiometric surface contours depicted on this map and groundwater elevations measured at MW-9 and MW-31, groundwater generally flows to the southeast under a mean hydraulic gradient of approximately 0.010 ft./ft. However, mounding, evident in the southeast portion of the Facility and centered near the condensate tank battery, results in a semi-radial flow configuration. Groundwater flow in this part of the Facility ranges from toward the east to southwest and appears to influence the LNAPL plume geometry.

#### 2.2 LNAPL Distribution and Condition

Golder measured LNAPL thickness in monitoring wells on October 25, 2021 as part of the sitewide synoptic gauging event. LNAPL thicknesses are summarized in **Table 1** and **Table 2** and depicted on **Figure 4**.

LNAPL was gauged at a measurable thickness (minimum 0.01 ft.) in 19 wells (MW-2A, MW-3, MW-22, MW-27, MW-32 through MW-35, MW-37, MW-38, RW-1, VW-1 through VW-4, HVR-1 and HV-1, HV-2 and HV-4) this reporting period. Based on the October 2021 gauging data, three discrete areas of elevated product thickness are evident within the LNAPL plume: 1) vicinity of wells MW-34, MW-35, MW-37 and MW-38, 2) vicinity of VW-1 and 3) vicinity of MW-3, HV-1 and HVR-1. Although average LNAPL thickness measured in wells decreased from 3.97 feet in August 2020 to 3.80 feet in October 2021, thicknesses generally decreased in the area extending from MW-37 to VW-4 but increased in the vicinity of MW-3. Changes in LNAPL thickness across the Site reflect local rising or falling groundwater levels. Since August 2020, groundwater levels within the LNAPL plume west of the Facility security fence have fallen but have risen in wells located east of the fence. LNAPL thicknesses measured in monitoring wells MW-27 and VW-1 have increased notably since July 2019 from an unmeasurable thickness and 0.19 foot, respectively to 2.42 feet and 4.81 feet, respectively in October 2021. Further, as shown in Figure 4, the LNAPL plume has receded in the east with no measurable product present in HV-3, HV-5 through HV-9 and MW-29 (near the eastern lateral extent of the groundwater bearing unit).

Diagnostic gauge plots provided in the *2019 Annual Groundwater Monitoring Report* prepared by Golder, dated July 20, 2020, indicated that LNAPL in MW-3, MW-22, MW-32, MW-34, MW-35, MW-37, VW-2 through VW-4, HV-1, HV-2, HV-7 and HVR-1 existed under unconfined conditions. Under unconfined conditions, LNAPL thickness in a monitoring well may increase as the water table falls allowing LNAPL to flow into the well. As the water table rises, LNAPL may become entrapped in the saturated zone and the apparent LNAPL thickness in the well reduces. When unconfined conditions are at equilibrium, the apparent LNAPL thickness in the well may closely match the equilibrium thickness of the mobile LNAPL interval intercepted by the well.

### 2.3 Groundwater Sampling

Golder conducted an annual groundwater sampling event on October 25-27, 2021. Monitoring well MW-5, which was discovered damaged during the August 2020 sampling event, was repaired and redeveloped prior to the October 2021 sampling event. As agreed in the February 22, 2018 meeting with OCD, groundwater samples were collected from thirteen of the following fourteen monitoring wells: MW-1, MW-5, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-30 and MW-31. The casing of monitoring well MW-28 was found deflected approximately 6 feet bgs which precluded sampling of the well with the pump available at the time. All groundwater samples were analyzed for chloride with samples collected from MW-6, MW-14, MW-18, MW-19, and MW-23 additionally analyzed for BTEX as agreed to by OCD in February 2018.

Prior to purging, static fluid levels were gauged to the nearest 0.01 ft. from TOC using an interface probe. Samples were collected using low flow purging/sampling techniques with a pneumatically powered bladder pump (dedicated disposable bladders), an in-line flow through cell with a multi-parameter water quality meter and dedicated down well polyethylene tubing for air supply and purge water discharge/sample collection. The pump intake was placed approximately midway within the water column and within the screened interval. While purging, typically at a rate of approximately 0.1 liters per minute, the water level was periodically monitored to ensure minimal drawdown and field parameters were measured every five minutes until stable conditions had been achieved for three consecutive measurements. Stabilization limits were ± 0.1 for pH, ± 3% for conductivity, ± 10% for dissolved oxygen (DO) and ± 10mv for oxidation reduction potential (ORP) in accordance with *EPA publication EPA/540/S-95/504 Low-Flow (Minimal drawdown) Ground-water Sampling Procedures* (April 1996). Groundwater samples were collected by disconnecting the flow cell and filling sample jars directly from the pump discharge.

Samples were analyzed for BTEX by SW-846 Method 8260C and chloride by EPA Method 300.

For quality assurance/quality control (QA/QC) purposes, trip blanks accompanied sample bottles from and back to the laboratory as a check on cross contamination during transport and storage. A blind field duplicate was collected from MW-23 (DUP) as a check on sampling reproducibility and analytical precision. An equipment blank was collected after sampling MW-6 to verify proper decontamination of equipment and to identify possible cross contamination. The trip blank samples were analyzed for BTEX only. The field duplicate and equipment blank samples were analyzed for BTEX and chloride. Additional sample volume was collected from MW-23 for matrix spike/matrix spike duplicate (MS/MSD) analysis.

Groundwater samples were placed on wet ice in an insulated cooler to reduce and maintain sample temperature at  $4 \pm 2$  degrees Celsius. Coolers were shipped by courier for overnight delivery to the analytical laboratory under proper chain-of-custody procedures. Samples were submitted to the Pace Analytical National laboratory located in Mount Juliet, Tennessee.

The submersible bladder pump, interface probe and flow-through cell were decontaminated prior to each use using a distilled water and laboratory-grade, phosphate free detergent solution (brushing as necessary) followed by a distilled water rinse. Purged groundwater was contained in an onsite tank that was discharged to a sump at the condensate tanks for subsequent disposal in the Facility's OCD permitted disposal well.

## 2.4 Groundwater Quality

BTEX and chloride analytical data for the thirteen monitoring wells included in the October 2021 groundwater sampling event are summarized along with historic data for these constituents of concern (COC) in **Table 3**. Laboratory analytical reports are provided in **Appendix A**. Groundwater COC concentrations have been

compared to the New Mexico Water Quality Control Commission (WQCC) Standards for Groundwater of 10,000 mg/L TDS Concentration or Less listed at NMAC 20.6.2.3103 (Human Health Standards and Other Standards for Domestic Water Supply).

According to NMAC 20.6.2.10, new regulations that included revisions to WQCC standards for benzene and toluene do not apply to any activity or condition subject to the authority of the Oil Conservation Commission pursuant to the provisions of the Oil and Gas Act, NMSA 1978, Section 70-2-12 and other laws conferring power on the Oil Conservation Commission and the Oil Conservation Division of the Energy, Minerals and Natural Resources Department to prevent or abate water pollution. As such, the WQCC standards for benzene and toluene at the Site were not revised.

**Table 2** and Benzene in Groundwater Concentration Map included as **Figure 5** shows that benzene was reported in a solitary well (MW-18) at a concentration exceeding the human health standard of 0.010 mg/L. Benzene was detected at 0.0638 mg/L in MW-18 this reporting period. However, benzene was not detected in the sample collected from MW-23 located approximately 130 feet southeast and hydraulically downgradient of the leading edge of the product plume. Total xylenes were detected at a maximum concentration of an estimated 0.000411 mg/L (MW-14) which is below the WQCC standard of 0.62 mg/L. Toluene and ethylbenzene were not detected above their method quantitation limits of 0.001 mg/L.

Chloride was detected at concentrations exceeding the domestic water supply standard of 250 mg/L in all wells sampled in October 2021 except MW-5. Chloride was detected at 374 mg/L, slightly exceeding the standard, in MW-23 located immediately downgradient of the LNAPL plume. Chloride in Groundwater Concentration Map included as **Figure 6** depicts chloride levels below the WQCC standard in groundwater samples collected from MW-5; a well located immediately downgradient of the LNAPL plume. Chloride concentrations of 318 mg/L and 1,480 mg/L in MW-1 and MW-8, respectively, located hydraulically upgradient of the Facility, exceeded the WQCC standard. Significantly elevated chloride concentrations were reported in MW-13 (5,730 mg/L), MW-14 (13,900 mg/L), MW-18 (17,200 mg/L), MW-19 (7,060 mg/L) and MW-30 (10,000 mg/L) located distal and downgradient of the Facility. Larson noted in the *2018 Groundwater Monitoring Report* that the highest chloride concentrations reported in MW-14 and MW-18 were in the vicinity of historic brine storage ponds associated with cavern storage operations.

## 2.5 Field Quality Assurance/Quality Control Sample Evaluation

BTEX constituents were not detected in the trip blank samples that accompanied sample jars from and back to the laboratory indicating no cross contamination during transport and storage. Golder calculated the relative percent difference (RPD) for the COCs analyzed in the parent sample/blind duplicate MW-23/DUP. The RPD of 2.6% calculated for chloride is regarded as acceptable for inorganic analytes. RPDs were not calculated for BTEX constituents as these analytes were not detected in either the parent or duplicate samples.

#### 3.0 LNAPL SOURCE INVESTIGATION

Golder understands that the OCD has acknowledged that the existing site characterization, existing monitoring well network, and associated reporting have satisfied the required elements of a Stage 1 Abatement Plan, including design and performance of a site investigation to adequately define Site conditions and provide the data necessary to select and design an effective abatement option. However, as the source of the LNAPL plume has not been identified and characterization/definition is crucial in developing an effective Stage 2 Abatement Plan for this Site, further assessment is required.

Golder initiated additional investigation activities at the Facility during 2019 to locate the source of the LNAPL plume. Based on data collected, additional investigation activities are required and will be scheduled. The identification of the LNAPL source is critical in developing an effective remedy for the Site. The results of the investigation will be submitted to OCD in a separate report.

#### 4.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the results of the groundwater monitoring event, Golder has the following conclusions:

- Based on the sitewide synoptic gauging event completed October 25, 2021 and groundwater elevations measured in MW-9 and MW-31, groundwater generally flows to the southeast under a mean hydraulic gradient of approximately 0.010 ft./ft. However, localized mounding in the southeast portion of the Facility results in a localized semi-radial flow configuration. Groundwater flow in the southeast corner of the Facility ranges from toward the east to south and appears to influence the LNAPL plume geometry.
- LNAPL was gauged at a measurable thickness in 19 wells (MW-2A, MW-3, MW-22, MW-27, MW-32 through MW-35, MW-37 through MW-38, RW-1, VW-1 through VW-4, HVR-1 and HV-1, HV-2 and HV-4) generally located in the southeast corner of the Facility this reporting period. Current data depict three areas of elevated LNAPL thickness within the product plume 1) in the vicinity of wells MW-34, MW-35, MW-37 and MW-38, 2) vicinity of VW-1 and 3) vicinity of MW-3. The average LNAPL thickness measured in wells decreased from 3.97 feet in August 2020 to 3.80 feet in October 2021. LNAPL thicknesses generally decreased in the western portion of the product plume but increased in the vicinity of MW-3. The changes in LNAPL thickness reflected either rising (reduced LNAPL thickness) or falling groundwater levels (increased LNAPL thickness) under unconfined conditions. However, a notable increase in LNAPL thickness recorded at VW-1 in October 2021 is associated with a rise in the groundwater level. The LNAPL plume receded in the east with no measurable product present in HV-3, HV-5 through HV-9 and MW-29 (near the eastern lateral extent of the groundwater bearing unit).
- Groundwater samples were collected by Golder using low-flow techniques from the following thirteen monitoring wells and analyzed for BTEX and chloride: MW-1, MW-5, MW-6, MW-8, MW-13, MW-14, MW-15, MW-18, MW-19, MW-20, MW-23, MW-30 and MW-31. Data collected in October 2021 were generally consistent (considering seasonal variability) to data obtained by Golder in April 2019 and August 2020 and results reported by Larson in June 2018.
- Benzene was detected at a solitary location (MW-18) at a concentration exceeding the applicable WQCC human health standard of 0.010 mg/L. Although benzene was reported at 0.0638 mg/L in MW-18, which is located distal/downgradient of the LNAPL plume, benzene was not detected in the sample collected from MW-23 located approximately 130 feet southeast and hydraulically downgradient of the leading edge of the product plume. Total xylenes were detected at a maximum concentration of an estimated 0.000411 mg/L (MW-14) which is below the WQCC standard of 0.62 mg/L. Toluene and ethylbenzene were not detected above the method quantitation limit of 0.001 mg/L.
- Chloride was detected at concentrations exceeding the WQCC domestic water supply standard of 250 mg/L in all wells sampled in October 2021 except at MW-5. Chloride was detected at 374 mg/L, slightly exceeding the standard, in MW-23 located immediately downgradient of the LNAPL plume. Elevated chloride concentrations were reported in MW-13 (5,730 mg/L), MW-14 (13,900 mg/L), MW-18 (17,200 mg/L), MW-19 (7,060 mg/L) and MW-30 (10,000 mg/L); wells located distal and downgradient of the Facility. MW-14 and MW-18 are reportedly located in the vicinity of historic brine storage ponds associated with cavern storage operations

Based on the above conclusions, Golder developed the following recommendations:

#### April 22, 2022

- Conduct the 2022 annual groundwater monitoring event in the first quarter of the year (sampling on progressively subsequent season schedule as requested by NMOCD). Samples will be analyzed for BTEX and chloride as agreed in the February 2018 meeting with OCD.
- Sample MW-28 with a smaller diameter submersible pump (that is not obstructed by the well casing deflection) in future events.
- Continue to investigate the LNAPL plume source.

#### Notes:

Elevations are above mean sea level (MSL) referenced to 1984 Geodetic Datum.

Groundwater elevation corrected for LNAPL thickness assuming 0.7 specific gravity

All values are in feet, unless otherwise noted.

bgs - below ground surface

TOC - top of casing

NR - Not recorded

<sup>\*</sup> Well completed at grade with no casing stickup

<sup>\*\*</sup>HV- high vacuum extraction well location

<sup>&</sup>lt;sup>1-</sup> MW-5 damaged. TOC elevation resurveyed following repair (6/7/2007 & 10/25/2021).

Notes:

Data reported in milligrams per liter (mg/L)

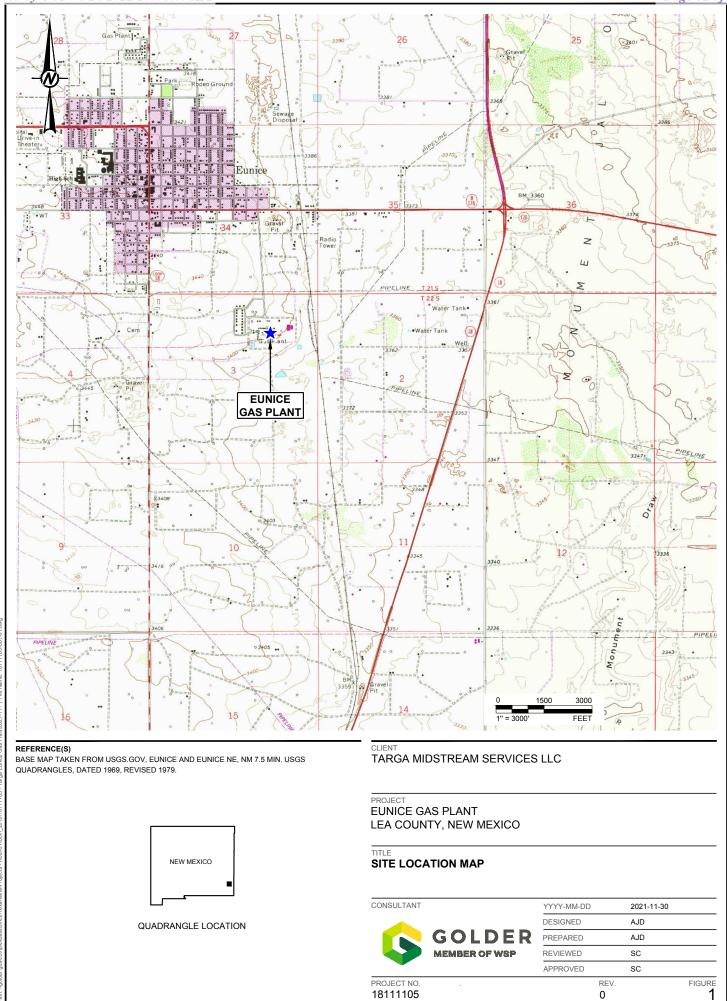

Data collected by others through June 14, 2018 and transposed from 2017 and 2018 Groundwater Monitoring Reports (Larson & Associates, Inc.)

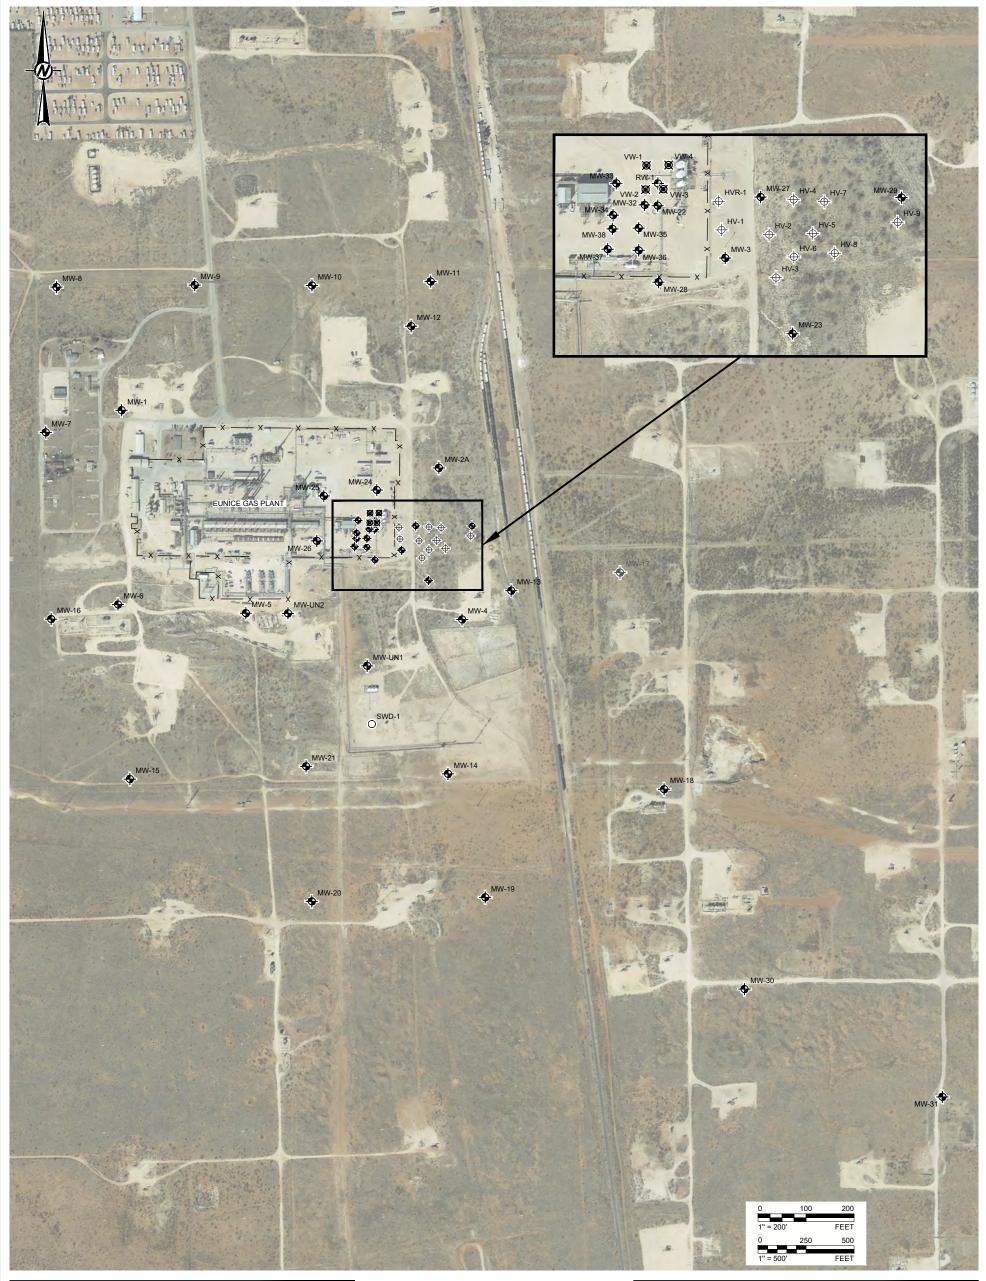

- < Denotes concentration below the method detection limit (MDL).
- -- Denotes chemical not analyzed
- J Estimated value >= Method Detection Limit (MDL) and < Limit of Quantitation (LOQ)
- (J) Estimated value Assigned through Data Validation (Relative Percent Duplicate > 40%)

LNAPL: Light non-aqueous phase liquid

Highlighted value denotes concentration exceeds New Mexico Water Quality Control Commission (WQCC) Standard for Groundwater of 10,000 mg/L TDS

Mark W. Beasley Project Manager Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

Project Manager

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

This data package consists of this signature page, the laboratory review checklist, and the following

- R1 Field chain-of-custody documentation;
- R2 Sample identification cross-reference;
- R3 Test reports (analytical data sheets) for each environmental sample that includes:
  - a. Items consistent with NELAC Chapter 5,
  - b. dilution factors,

reportable data as applicable:

- c. preparation methods,
- d. cleanup methods, and
- e. if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate recovery data including:
  - a. Calculated recovery (%R), and
  - b. The laboratory's surrogate QC limits.
- R5 Test reports/summary forms for blank samples;
- R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  - a. LCS spiking amounts,
  - b. Calculated %R for each analyte, and
  - c. The laboratory's LCS QC limits.
- R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  - a. Samples associated with the MS/MSD clearly identified,
  - b. MS/MSD spiking amounts,
  - c. Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  - d. Calculated %Rs and relative percent differences (RPDs), and
  - e. The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  - a. The amount of analyte measured in the duplicate,
  - b. The calculated RPD, and
  - c. The laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
- R10 Other problems or anomalies.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

Mark W. Beasley Project Manager

<sup>1.</sup> Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);

3. NA = Not applicable;

4. NR = Not reviewed;

<sup>5.</sup> ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

<sup>1.</sup> Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);

3. NA = Not applicable;

4. NR = Not reviewed;

5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

Revised May 2010 Laboratory Review Checklist: Exception Reports

	·	'				
Laborat	tory Name: Pace Analytical National	LRC Date: 11/18/2021 10:19				
Project	Name: Eunice Gas Plant Ann. GW	Laboratory Job Number: L1422809-01, 02, 03, 04, 05 and 06				
Review	ver Name: Mark W. Beasley	Prep Batch Number(s): WG1766358 and WG1774955				
ER #1	Description					
1	9056A WG1774955 R3730953-5 and 6: The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).					
2	8260B WG1766358 4-Bromofluorobenzene R3726579-5: Percent Recovery is outside of established control limits.					
3	9056A WG1774955 Chloride: Percent Reco	very is outside of established control limits.				

<sup>1.</sup> Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);

3. NA = Not applicable;

4. NR = Not reviewed;

5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

#### Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

#### Abbreviations and Definitions

Abbreviations and	d Definitions
MDL	Method Detection Limit.
MQL	Method Quantitation Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
SDL	Sample Detection Limit.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Sample Detection Limit.
Unadj. MQL	Unadjusted Method Quantitation Limit.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Е	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits.
V	The sample concentration is too high to evaluate accurate spike recoveries.

Mark W. Beasley

Project Manager

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

This data package consists of this signature page, the laboratory review checklist, and the following reportable data as applicable:

- R1 Field chain-of-custody documentation;
- R2 Sample identification cross-reference;
- R3 Test reports (analytical data sheets) for each environmental sample that includes:
  - a. Items consistent with NELAC Chapter 5,
  - b. dilution factors,
  - c. preparation methods,
  - d. cleanup methods, and
  - e. if required for the project, tentatively identified compounds (TICs).
- R4 Surrogate recovery data including:
  - a. Calculated recovery (%R), and
  - b. The laboratory's surrogate QC limits.
- R5 Test reports/summary forms for blank samples;
- R6 Test reports/summary forms for laboratory control samples (LCSs) including:
  - a. LCS spiking amounts,
  - b. Calculated %R for each analyte, and
  - c. The laboratory's LCS QC limits.
- R7 Test reports for project matrix spike/matrix spike duplicates (MS/MSDs) including:
  - a. Samples associated with the MS/MSD clearly identified,
  - b. MS/MSD spiking amounts,
  - c. Concentration of each MS/MSD analyte measured in the parent and spiked samples,
  - d. Calculated %Rs and relative percent differences (RPDs), and
  - e. The laboratory's MS/MSD QC limits
- R8 Laboratory analytical duplicate (if applicable) recovery and precision:
  - a. The amount of analyte measured in the duplicate,
  - b. The calculated RPD, and
  - c. The laboratory's QC limits for analytical duplicates.
- R9 List of method quantitation limits (MQLs) and detectability check sample results for each analyte for each method and matrix.
- R10 Other problems or anomalies.

Release Statement: I am responsible for the release of this laboratory data package. This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted in the Exception Reports. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory in the Exception Reports. By my signature below, I affirm to the best of my knowledge all problems/anomalies observed by the laboratory have been identified in the Laboratory Review Checklist, and no information affecting the quality of the data has been knowingly withheld.

#### Description ER #1

The Exception Report intentionally left blank, there are no exceptions applied to this SDG.

- 1. Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

  2. O = organic analyses; I = inorganic analyses (and general chemistry, when applicable);
- NA = Not applicable;
   NR = Not reviewed;
- 5. ER# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

#### Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

#### Abbreviations and Definitions

MDL	Method Detection Limit.
MQL	Method Quantitation Limit.
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
SDL	Sample Detection Limit.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Sample Detection Limit.
Unadj. MQL	Unadjusted Method Quantitation Limit.
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the resu reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section fo each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

#### Qualifier Description

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

	[UF-GWA] Ground Water Abatement (GROUND WATER ABATEMENT)						

#### CONDITIONS

Created By	Condition	Condition Date
michael.buchanan	Review of the 2021 Annual Groundwater Monitoring Report for Targa Midstream Eunice Gas Plant Site: Content Satisfactory 1. Continue to conduct groundwater monitoring as prescribed by NMOCD. 2. Considerations for high chloride impact to monitoring wells may need to be analyzed for a remediation technology treatment such as ion exchange or reverse osmosis. 3. Please continue to submit annual groundwater monitoring reports for 2022, and 2023 by April 1, 2024. 4. Continue investigation of LNAPL source as necessary.	10/27/2023
