**Re: 2021 Annual Monitoring and Remedial Activities Report
ConocoPhillips – Maljamar E&P
Lea County, New Mexico (AP-115-1)**

Mr. Billings:

This report details the continuing groundwater monitoring and remedial activities at the ConocoPhillips Company (COP) Maljamar E&P site located in Lea County, New Mexico. The Site is located approximately 3.5 miles south-southwest of Maljamar, New Mexico, and adjacent to the north of the Maljamar Gas Plant operated by Phillips 66. The Site location is shown in Figure 1. The Site was assigned the identifier AP-115-1 by the New Mexico Oil Conservation District (NMOCD). The Site and surrounding areas are rural grasslands used primarily for oil and gas production.

1.0 BACKGROUND AND PREVIOUS INVESTIGATIONS

Between 2000 and 2005, the NMOCD conducted several field investigations at the Maljamar Gas Plant. On July 6, 2006, a release of approximately 23 barrels of produced water was discovered at the Site. The release flowed into a drainage way west of the MCA Battery 2 and affected an area approximately 750 feet long and 30 feet wide. Groundwater samples and water level data were collected, surface and borehole geophysical surveys were performed, and an aquifer pump test was performed.

On October 17, 2014, a letter was submitted to the NMOCD listing wells that would be managed by COP following the split of ConocoPhillips upstream and downstream assets. Groundwater monitoring wells managed as part of this Site included MW-11, MW-12, MW-13, MW-14, and MW-19, and extraction well EW-1. Based on the distance from the Site, MW-18 and MW-20 were considered to be unrelated and would no longer be monitored. A map of the extraction and monitor wells is shown in Figure 2.

In June 2007, the groundwater extraction well EW-1 was installed adjacent to monitor well MW-12, and an additional extraction well (EW-2) was installed in September 2017, but was off-line intermittently between 2018 and 2020 due to power and maintenance issues. The pump was replaced, and the system was back in full operation by May 2021. The extracted groundwater is pumped into a flowline connected to an off-site 210 barrel tank and transported to the MCA Unit Battery #2.

REVIEWED

By Mike Buchanan at 9:08 am, Jan 09, 2024

Review of the 2021 Annual Monitoring and Remedial Activities Report for the Maljamar E&P:
Content Satisfactory

1. Conoco Phillips must consider and propose other remediation options, for example, reverse osmosis, ion exchange, etc. The NMOCD does not agree that natural attenuation is sufficient to abate groundwater at the site with significantly high TDS, Sulfate and Chloride contamination.
2. Please submit a work plan with a proposed remediation plan to implement at the site.
3. Continue to conduct groundwater monitoring on a quarterly or semi-annual basis.
4. Submit the 2022 and 2023 Annual Groundwater report to NMOCD by April 1, 2024.

Phase separated hydrocarbons (PSH) have not been historically found at the site. Historical groundwater analytical results have documented concentrations of chloride, nitrate, sulfate, and total dissolved solids (TDS) above the applicable New Mexico Water Quality Control Commission (NMWQCC) standards in samples collected from EW-1, EW-2, MW-11, MW-12, MW-13, and MW-14. From 2009 through 2011, concentrations of benzene exceeded the applicable NMWQCC standard in MW-11.

2.0 HYDROGEOLOGY

The water-bearing zone consists of the Pliocene-age Ogallala aquifer under unconfined conditions at the site. The Ogallala aquifer is located at the base of the Ogallala Formation. In general, the Ogallala Formation consists of quartz sand and gravel that is poorly to well-cemented with calcium carbonate and contains minor amounts of clay. The wells installed at the site were drilled to depths of approximately 120 feet bgs with static groundwater water levels of approximately 90 feet bgs.

3.0 2021 GROUNDWATER MONITORING

3.1 Methodology

Prior to purging the wells, each well was gauged to measure the depth to groundwater and phase separated hydrocarbons (PSH), if any. The water levels and the PSH measurements are summarized in Table 1. The annual groundwater monitoring event occurred on August 10, 2021. No PSH was identified in the wells in 2021. All wells were gauged except EW-2, as the extraction pump was in operation at this well. However, a sample port was added to EW-2 and therefore a groundwater sample was collected. All wells in the well network for the Site were sampled. Each well was sampled utilizing low flow sampling techniques.

Groundwater samples were collected and analyzed for the following:

- bromide by EPA Method 300.0;
- chloride by EPA Method 300.0;
- sulfate by EPA Method 300.0; and
- Total dissolved solids (TDS) by SM Method 2540C.

Groundwater samples were transported to Pace Analytical Services, LLC, in Allen, TX under chain-of-custody documentation for the 2021 sampling event. Table 2 presents a summary of the groundwater analytical results screened against NMWQCC groundwater quality standards. The laboratory analytical report and chain-of-custody documentation are presented in Appendix A, chloride, sulfate, and TDS concentration maps are provided in Figures 4 through 6, and chloride concentration trend graphs are presented in Appendix B.

3.2 2021 Groundwater Gradient

A groundwater gradient map was generated for the August 2021 sampling event and is included as Figure 3. The hydraulic gradient for the aquifer was generally consistent with historical data to the northeast with an average hydraulic gradient of 0.00689 in 2021.

3.3 2021 Groundwater Analytical Results

During the August 2021 monitoring event, all wells (EW-1, EW-2, MW-11, MW-12, MW-13, MW-14, and MW-19) were sampled.

The concentrations of constituents of concern (COCs) in the following wells were reported at concentrations greater than NMWQCC standards:

- Chloride was reported in EW-1 (27,500 mg/L), EW-2 (27,500 mg/L), MW-11 (1,210 mg/L), and MW-12 (39,700 mg/L) at concentrations greater than the NMWQCC standard of 250 mg/L;
- Sulfate was reported in MW-12 (1,500 mg/L) and MW-14 (862 mg/L) at concentrations greater than the NMWQCC standard of 600 mg/L; and
- TDS was reported in EW-1 (38,100 mg/L), EW-2 (37,500 mg/L), MW-11 (3,180 mg/L), MW-12 (70,500 mg/L), MW-13 (1,100 mg/L), and MW-14 (1,290 mg/L) at concentrations greater than the NMWQCC standard of 1,000 mg/L.

Chloride concentrations appear to be generally stable or decreasing in the majority of the wells. No NMWQCC standard exceedances were reported in MW-19 during 2021.

4.0 GROUNDWATER EXTRACTION

Between 2018 and 2021, the groundwater extraction pump at EW-2 was intermittently operational and in need of repairs. On March 23, 2021, the extraction pump was removed from EW-2 and replaced with a new pump. Throughout April and May 2021, several additional repairs were made to the system, including the installation of a pump saver, piping repair and replacement, and meter replacement. The system was back to fully operational by May 28, 2021.

Between May and December 2021, the groundwater extraction system removed approximately 28,000 gallons of groundwater. The extracted groundwater is pumped into a flowline connected to an off-site 210-barrel tank and transported to the MCA Unit Battery #2 for disposal by injection.

5.0 WORK PLAN

Groundwater extraction and disposal has been used as a remediation technique at the Site for approximately 15 years with limited success in significantly reducing concentrations of constituents of concern (COCs). Therefore, Tetra Tech believes that long-term natural attenuation/dilution is the primary mechanism that

2021 Annual Groundwater Monitoring and Remedial Activities Report
ConocoPhillips - Maljamar E&P, AP-115-1
Lea County, New Mexico
April 7, 2022

will reduce concentrations of chloride, sulfate, and TDS in groundwater, therefore, Tetra Tech proposes shutting off the extraction system currently in operation at the Site. If significant changes to COC concentrations are identified in the future, the operation of the extraction system can be re-evaluated. Groundwater monitoring and sampling of the on-site wells will be continued on an annual basis, with annual reporting to the New Mexico Oil Conservation Division.

If you have any questions please call Julie Evans at (432) 258-3451.

Sincerely,
Tetra Tech, Inc.

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
RDL	Reported Detection Limit.	² Tc
Rec.	Recovery.	³ Ss
RPD	Relative Percent Difference.	⁴ Cn
SDG	Sample Delivery Group.	⁵ Sr
U	Not detected at the Reporting Limit (or MDL where applicable).	⁶ Qc
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁷ Gl
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	⁸ Al
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	⁹ Sc
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier

Description

B	The same analyte is found in the associated blank.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.

michael.buchanan	Review of the 2021 Annual Monitoring and Remedial Activities Report for the Maljamar E&P: Content Satisfactory 1. Conoco Phillips must consider and propose other remediation options, for example, reverse osmosis, ion exchange, etc. The NMOCD does not agree that natural attenuation is sufficient to abate groundwater at the site with significantly high TDS, Sulfate and Chloride contamination. 2. Please submit a work plan with a proposed remediation plan to implement at the site. 3. Continue to conduct groundwater monitoring on a quarterly or semi-annual basis. 4. Submit the 2022 and 2023 Annual Groundwater report to OCD by April 1, 2024.	1/9/2024
