13. Describe proposed or completed operations. (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work). SEE RULE 19.15.7.14 NMAC. For Multiple Completions: Attach wellbore diagram of proposed completion or recompletion.

Report for the Month ending October 31, 2022 Pursuant to Workover C-103 for Linam AGI#1 and AGI#2

This is the 126th monthly submittal of data as agreed to between DCP and OCD relative to injection pressure, TAG temperature and casing annulus pressure and bottom hole data for Linam AGI #1. Since the data for both wells provide the best overall picture of the performance of the AGI system, the data for both wells are analyzed and presented herein even though that analysis is required only on a quarterly basis for AGI #2.

All flow this month continued to be directed to AGI#1. AGI#2 was not used at all this month and had no flow directed to it. Injection parameters being monitored for AGI #1 were as follows (Figures #1, #2, #3 & #4): Average Injection Rate 174,316 scf/hr, Average TAG Injection Pressure: 1,598 psig, Average TAG Temperature: 102°F, Average Annulus Pressure: 61 psig, Average Pressure Differential: 1,537 psig. Bottom hole (BH) sensors provided the average BH pressure for the entire period of 4,493 psig slightly lower than last month and BH temperature of 132°F (Figures #8 & #9) slightly lower than last month. The BH pressure has levelled off with the continued use of AGI#1 only since February 1, 2022. AGI #1 continued to be used exclusively this month (see Figures #5, #6 & #7).

The recorded injection parameters for AGI #2 for the month were: Average Injection Rate 0 scf/hr (AGI#2 was not used this month), Average Injection Pressure: 1,265 psig, Average TAG Temperature: 80°F, Average Annulus Pressure: 231 psig, Average Pressure Differential: 1,034 psig. All the acid gas flow had been to AGI #2 since 3/1/2021 and was switched to AGI#1 on 2/1/2022 to assure the continued operational readiness of both wells. Bottom Hole Sensors in AGI #2 are not operating because they were damaged in a lightning strike shortly after AGI #2 was commissioned, however, because the injection zones for AGI #1 and AGI #2 are only about 450 feet apart, the bottom hole readings for AGI #1 are reflective of the general reservoir conditions for both wells. DCP has officially requested from OCD approval to implement a strategy for eventual replacement of the bottom hole sensors in AGI #2 and is currently awaiting approval. With the switchover to AGI #1 on 2/1/2022, we observed the anticipated rise in BHP and decrease in BHT at AGI#1 after injection to that well was reestablished; however, that has levelled off over this period.

The Linam AGI#1 and AGI #2 wells are serving as a safe, effective and environmentally-friendly system to dispose of, and permanently sequester, Class II wastes consisting of H_2S and CO_2. The two wells provide the required redundancy to the plant that allows for operation with disposal to either or both wells. I hereby certify that the information above is true and complete to the best of my knowledge and belief.
