Zia AGI #1 MAOP 2,233 psig NMOCC Order R-13809 / Zia AGI D #2 MAOP 5,208 psig NMOCC Order R-14207

Annual Report for the period from January 1 through December 31, 2022 Pursuant to NMOCC Orders R-13809 and R-14207 for Zia AGI #1 and AGI D #2, respectively.

This report includes the summary of quarterly injection data and analysis of surface injection pressure, TAG temperature, casing annular pressure as well as downhole injection pressure, temperature, and annular pressure for the Zia AGI #1 and for the Zia AGI D #2 for 2016 through 2022. While this is an annual summary, the cumulative values are included in order to provide a historical overview of the entire time frame of use. AGI D #2 continues to be the primary well for this facility with the Zia AGI #1 to be used only as a redundant and backup well. Based on data for surface injection/annular pressure and their current MITs, both wells continue to show excellent integrity. Rapid, drastic temperature swings were observed in AGI D #2 surface data beginning in the second half of Q2 2022 due to malfunctioning louvers in the compression system. This issue was repaired during a scheduled plant turnaround in Q4 2022 and the AGI D #2 temperature has begun to stabilize. In spite of these fluctuations, average surface temperature for AGI D #2 only increased one degree relative to the 2021 average temperature. The annual summary of injection data is included herein, and all of the values presented below are averages for the static conditions in the AGI #1 since the well has not been in operation since 2/7/2017 and only AGI D #2 operated for most of 2017 and exclusively since that time. AGI #1 serves only as a redundant well in the event of a problem that requires intervention in AGI D #2.

AGI #1 Surface Measurements for Entire Period (inactive since Q1 2017):

Average TAG Line Pressure: 507 psig, Average Annular Pressure: 142 psig, Average Pressure Differential: 365 psig, Average TAG Line Temperature: 83 °F, Average TAG injection rate: 478 MMSCFD for entire period (not used since 2017).

AGI #1 Downhole Measurements for Entire Period (inactive since Q1 2017):

Average bottom hole pressure: 3,441 psig, Average annular bottom hole pressure: 2,229 psig, Average bottom hole TAG Temperature: 98 °F.

AGI D #2 Surface Measurements for Entire Period:

Average TAG Injection Pressure: 1,648 psig, Average Annular Pressure: 280 psig, Average Pressure Differential: 1,367 psig, Average Tag Temperature: 113 °F, Average TAG injection rate: 4,836 MMSCFD (AGI D #2 used exclusively in 2022).

AGI D #2 Downhole Measurements for Entire Period:

Average bottom hole pressure: 6,236 psig, Average bottom hole TAG Temperature: 167 °F.

The data gathered through the fourth quarter of normal operations in 2022 demonstrate the correlative behavior of the annular pressure with the flowrate, injection pressure and temperature and confirm that both wells have good integrity, are functioning appropriately, and within the requirements of their respective NMOCC orders. Well AGI D #2 displays excellent reservoir characteristics, easily accommodating the required volumes of TAG from the facility. This well will continue to be used as the primary disposal well for the facility with the AGI #1 well being operated as needed to confirm functionality and to allow for any required future maintenance on the AGI D #2 well.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.

ANALYSIS OF ANNUAL TRENDS AND REQUEST TO CONTINUE WITH APPROVED IMMEDIATE NOTIFICATION PARAMETERS FOR OPERATION OF ZIA AGI #1 AND ZIA AGI D #2 (API #s 30-025-42208 AND 30-025-42207) UNDER R-13809 and R-14207

This document presents the results from the analyses of the injection parameter data collected from the Zia AGI #1 and D #2 wells that serve the Zia Ranch Gas Processing Facility in Lea County, NM. Data from the Zia AGI #1 have been collected since its initial operation in 2015 through the time when the well was placed on backup/standby status after the commissioning of the Zia AGI D #2 on February 7, 2017. Similarly, for AGI D #2, data have been continuously collected and have been analyzed by Geolex and transmitted to DCP for reporting to NMOCD on a quarterly basis as per the two NMOCC orders referenced above. The AGI D #2 well was completed in the Devonian through the Montoya section as a vertical well approximately 250 feet southwest of the AGI #1, which was completed in the Cherry Canyon and Brushy Canyon units of the Delaware Mountain Group. From the time that the AGI D #2 was brought online, injection has been solely into AGI D #2 with AGI #1 now maintained in standby status as a backup well for the facility should circumstances require some interruption of flow to the AGI D #2 for maintenance or repairs.

This operational mode (utilizing only AGI D #2) will continue indefinitely with AGI #1 being used only as a backup standby well. In order to continue to record reservoir data in AGI #1 we review and monitor bottom hole data in the well which is unaffected by its standby status. Bottom hole sensors for AGI D #2 provide data on reservoir conditions in the deeper Devonian reservoir and both downhole sensors are providing reliable data on both reservoirs. In addition, surface data from both wells is being collected. The following surface and bottom hole parameters are monitored:

- Treated Acid Gas (TAG) surface injection pressure
- TAG injection temperature
- Annular pressure
- Bottom hole pressure and temperature
- TAG flow rate from compressors to each well independently

The above are the key parameters which are currently being measured to monitor the operations of the wells, prevent hydrate formation, and reduce corrosion potential. Since these parameters are useful indicators and predictors of potential operational or mechanical problems in the well, various levels of alarms have been established for each of these parameters. The surface parameters include three that are measured directly (TAG injection pressure, TAG injection temperature and annular pressure) and one (differential pressure) which is a calculated value (the difference between the two measured parameters of injection and annular pressure). The analyses of the long-term trends in these values have been useful in smoothing out shorter-term variations, which can be observed from detailed inspection of hourly data, and in the development of appropriate alarm bands for each parameter. These data are included as Table 1.

Both wells at Zia are equipped with bottom hole (at top of packer) pressure and temperature measurement capability inside the tubing. The monitoring of these additional parameters will also aid significantly in determining the appropriate immediate notification parameters which are required by the NMOCC order for AGI D #2. The immediate notification parameters for both wells were developed from this long-term analysis of the injection data.

The NMOCD also requires that immediate notification parameters and levels be discussed and agreed upon with the agency, and that these be periodically reviewed and updated as needed based on operational or regulatory changes. The immediate notification parameters for both wells have been approved by NMOCD and DCP requests no changes in these approved values. With this requirement in mind, and for the purpose of protecting the mechanical integrity and safety of both wells and the overall AGI facility, Geolex monitors these data under contract to DCP to prevent damage to the wells or violation of regulatory requirements or permit constraints.

After six years of carefully analyzing the performance of AGI #1 and AGI D #2 on a continuous basis, Geolex has assembled the data and has analyzed observed trends for the 2016 through 2022 timeframe as can be seen in Figures 1 – 5.

Given the observations of the trends in the graphs and the significantly different behavior of both wells, the wells demonstrate good mechanical integrity. Minor fluctuations in the Zia AGI #1 surface data continue to demonstrate the correlative behavior of the annual pressure with flowrate, injection pressure, and temperature (Figure 1). Downhole pressure in the Zia AGI #1 reservoir has dropped slowly following cessation of injection (early 2017) and has stabilized as can be seen in Figure 3. AGI D #2 continues to exhibit a strong correlative relationship of annular pressure with injection pressure, injection temperature, and flowrate confirming the integrity of the well. Additionally, over the operational lifetime of AGI D #2, the bottom hole pressure has only increased by about 5% (300 psig) while there has been a 20% increase (0.89 MMSCFD) in injection rate indicating continued adequate reservoir conditions for TAG injection.

Rapid temperature swings in the surface data of AGI D #2 were identified in the second quarter of 2022 that were attributed to a malfunction in the louvers in the compression system. Maintenance completed during a scheduled plant turnaround in October 2022 addressed this issue and the temperature appears to be stabilizing. In spite of the variations in temperature, the well behaved appropriately with concurrent changes in injection pressure and annulus pressure. The average temperature for 2022 was only one degree higher than the average temperature reported for 2021 (118 °F vs 117 °F). The trends observed in AGI D #2 are shown in Figures 2 and 4 and total flow rates are summarized on Figure 5 for the entire period.

Upon startup from any shutdown that lasts more than 6-8 hours it is critical to inject methanol along with the TAG for the initial startup period to prevent the formation of hydrates. It is also critical to maintain the temperature control on the injected TAG and to avoid rapid temperature or pressure fluctuations during periods when power failures or other mechanical failures may occur.

REVIEW OF STATISTICAL ANALYSIS OF INJECTION PARAMETERS, DEVELOPMENT OF AND REQUEST TO CONTINUE WITH APPROVED IMMEDIATE NOTIFICATION PARAMETERS FOR ZIA AGI #1 AND ZIA AGI D #2 (API #s 30-025-42208 AND 30-025-42207) UNDER R-13809 and R-14207

The statistical analyses of the injection parameter data were initially conducted for the purpose of establishing normal operating levels for these parameters which are automatically monitored. Several data filtering steps were accomplished to take the hourly data which forms the basis of the analysis in order to smooth out variability due to normal operations. Since the commissioning of the AGI D #2, only that well has been operated and this operating approach will continue with the AGI #1 serving as a redundant and backup well in the event that maintenance is required on the AGI D #2. The bottom hole pressure and temperature sensors in the two wells have provided excellent reservoir condition data for both wells.

All the data are summarized in Table 1. Based on the analysis of trends, the immediate notification parameters, which were approved for AGI D #2, and the parameters previously approved for AGI #1 and continued through 2022, remain appropriate to continue through 2023. DCP requests continuation of the previously approved immediate notification parameters detailed below:

The approved immediate notification parameters for Zia AGI #1 (which is inactive) are summarized below:

1. Exceedance of the approved MAOP of 2,233 psig surface for a period greater than two hours.
2. Failure of a mechanical integrity test (MIT) of the well.
3. Confirmation of any condition that indicates a tubing, packer or casing leak.
4. Any increase of the annular pressure to a value that is more than 80% of the injection pressure.
5. Any release of H₂S at the well which results in an activation of the facility's approved Rule 11 H₂S contingency plan.
6. Any workover or maintenance activity that requires intrusive work in the well.

The approved immediate notification parameters for the Zia AGI D #2 (which is the active well at the facility) are summarized below:

1. Exceedance of the approved MAOP of 5,028 psig surface for a period greater than two hours.
2. Failure of a mechanical integrity test (MIT) of the well.
3. Confirmation of any condition that indicates a tubing, packer or casing leak.
4. Any increase of the annular pressure to a value that is more than 80% of the injection pressure.
5. Any release of H₂S at the well which results in an activation of the facility's approved Rule 11 H₂S contingency plan.
6. Any workover or maintenance activity that requires intrusive work in the well.

Figure 1. ZIA AGI #1 Surface Injection Data

AGI D #2 ONLY IN OPERATION AFTER FEBRUARY 7, 2017

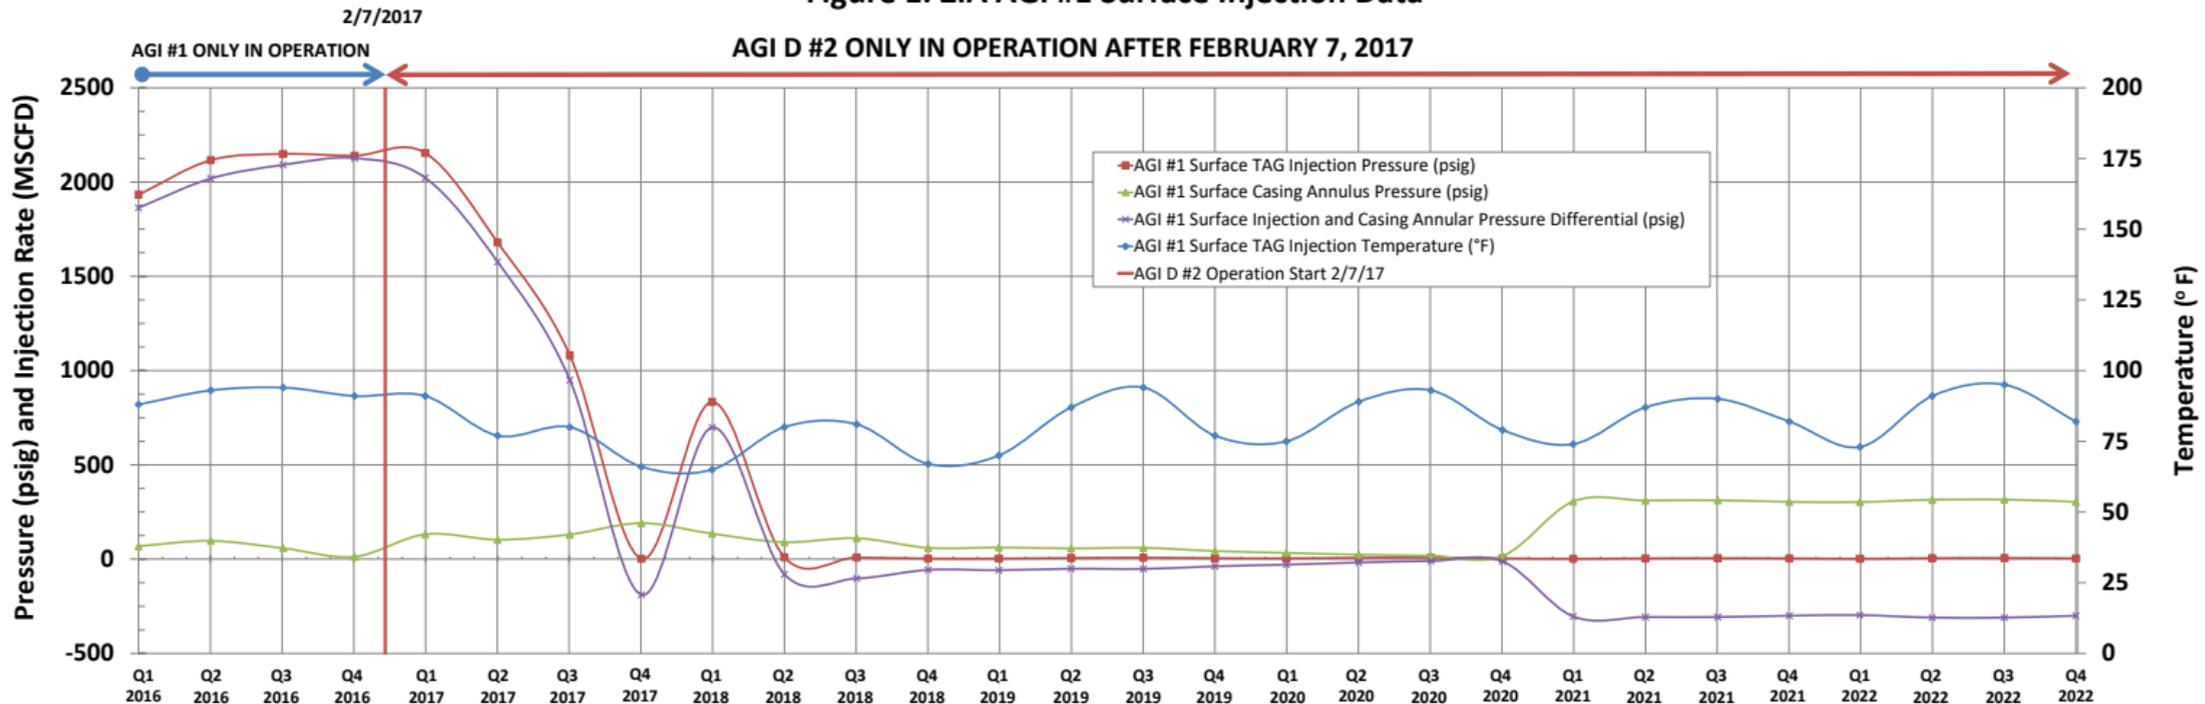

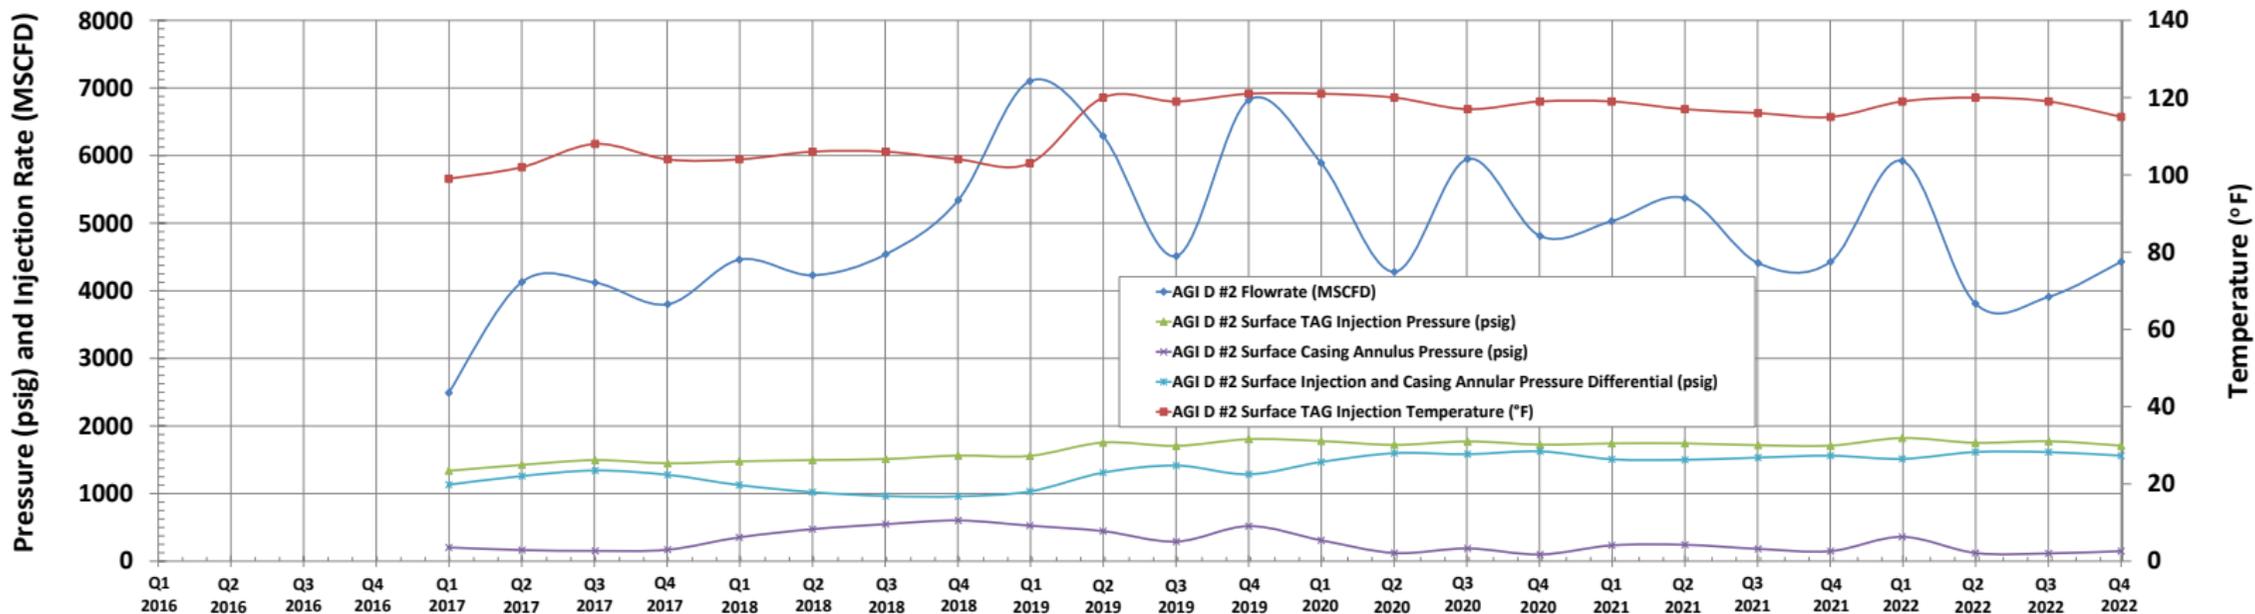

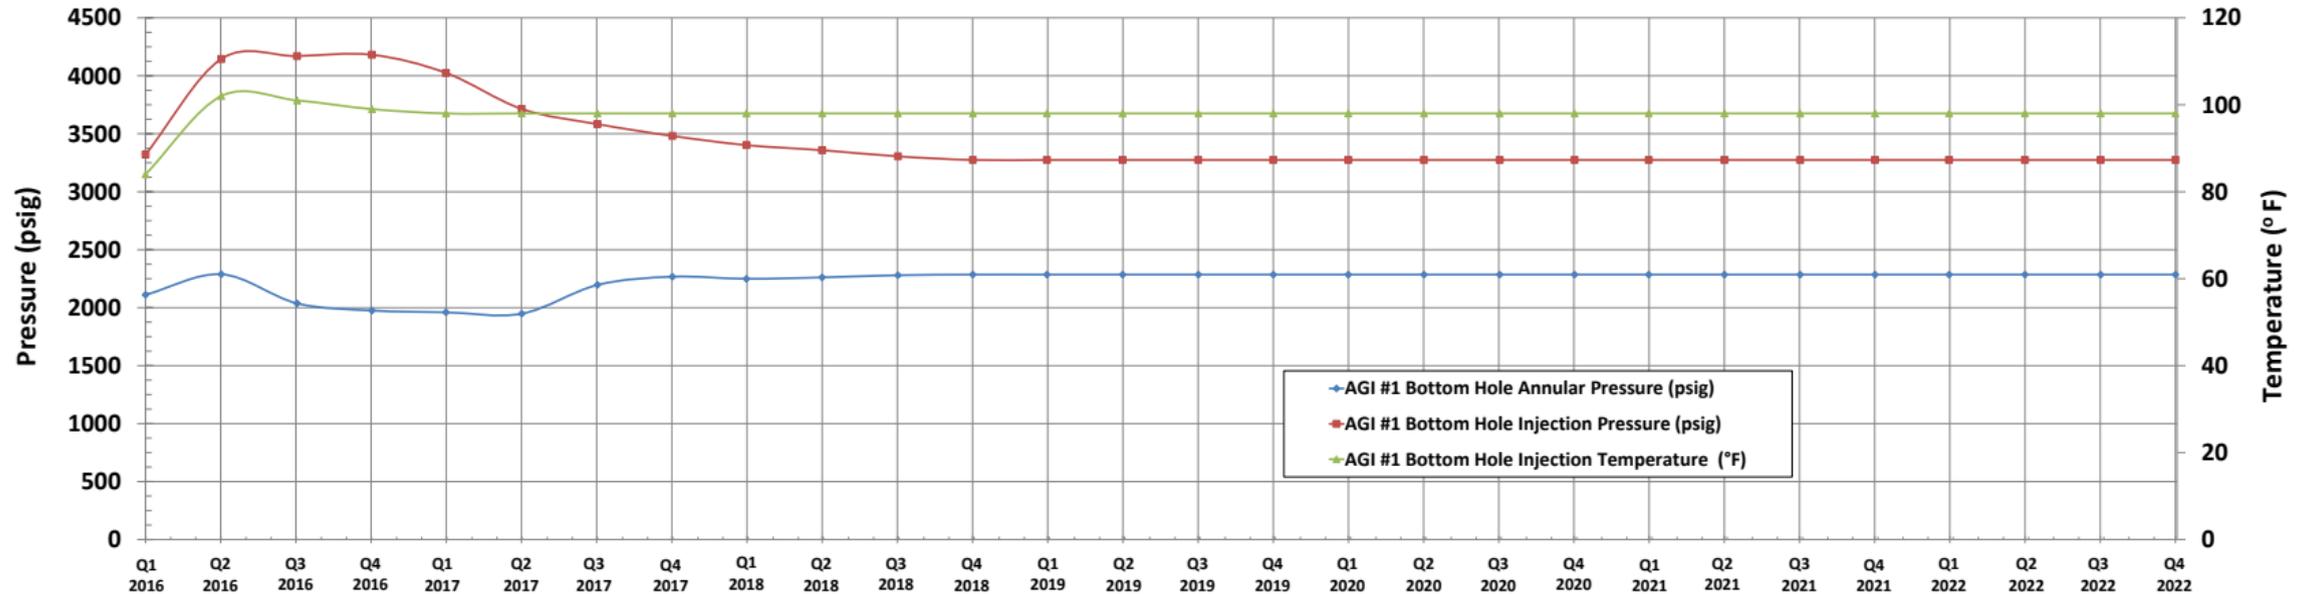

Figure 2. Zia AGI D #2 Surface Injection Data

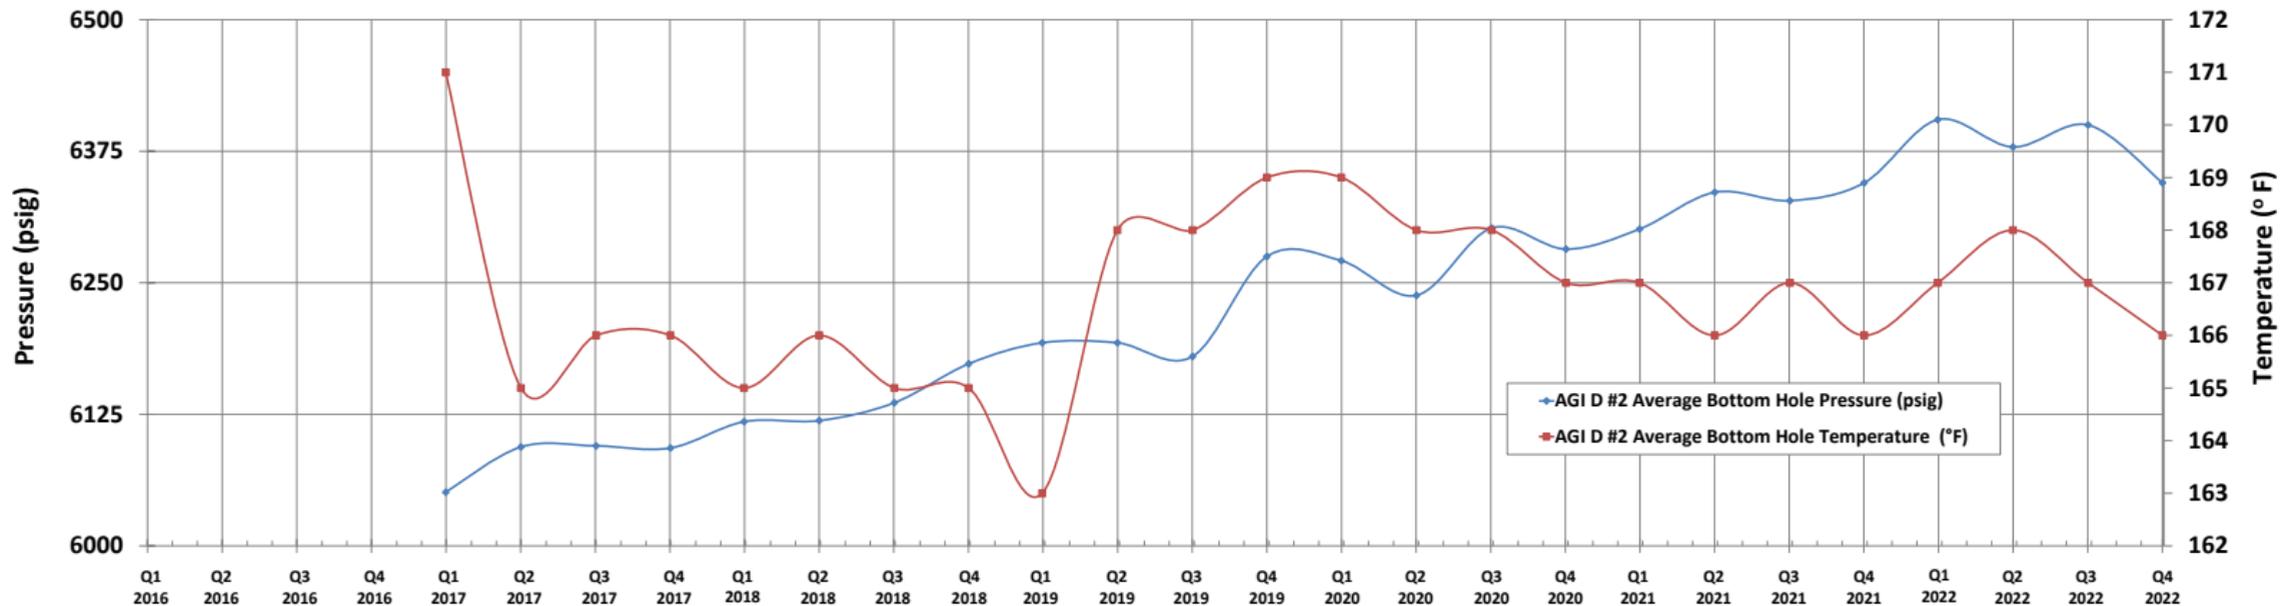

AGI D #2 WAS BROUGHT ONLINE ON 2/7/2017 AND HAS OPERATED AS THE SOLE AGI WELL TAKING ALL THE TAG FROM THE ZIA PLANT SINCE THAT DATE. AGI #1 IS USED ONLY AS A BACKUP WELL IN THE EVENT THAT AGI D #2 REQUIRES SHUTDOWN FOR MAINTENANCE OR REPAIR.

Figure 3. Zia AGI #1 Bottom Hole Data

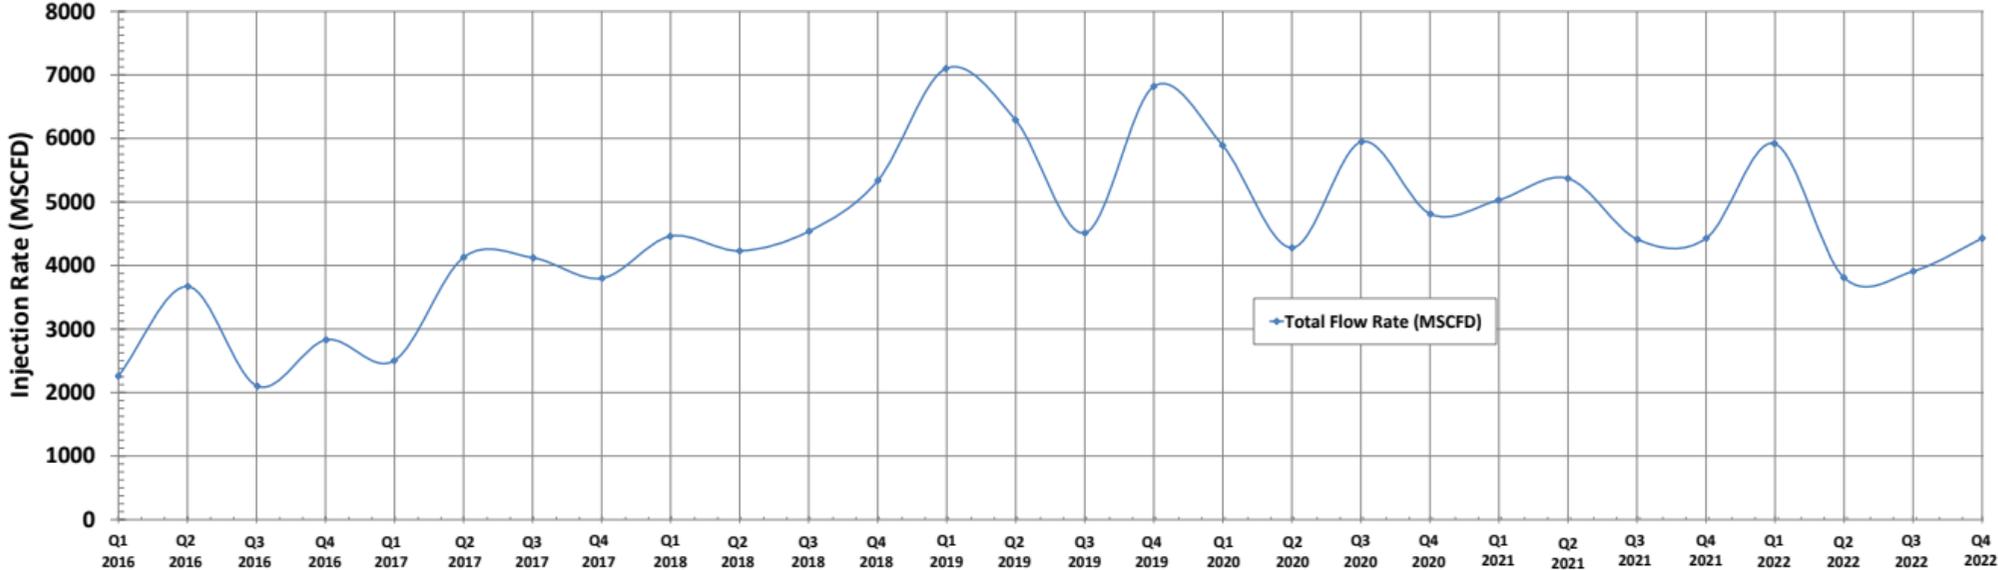

AGI #1 WAS IN USE FROM EARLY 2016 THROUGH 2/7/2017 -- NOTE THE DROP IN BOTTOM HOLE PRESSURE AND SLIGHT INCREASE IN BOTTOM HOLE TEMPERATURE IN Q1 2017 IN RESPONSE TO CESSATION OF INJECTION INTO AGI #1. BY 2020 THE PRESSURE AND TEMPERATURE VALUES IN THE RESERVOIR HAVE STABILIZED AND RETURNED TO PRE-INJECTION CONDITIONS.

Figure 4. Zia AGI D #2 Bottom Hole Data

AGI D #2 WAS BROUGHT ONLINE ON 2/7/2017 -- NOTE THE DROP IN BOTTOM HOLE TEMPERATURE AND INCREASE IN BOTTOM HOLE PRESSURE BEGINNING IN Q1 2017 IN RESPONSE TO INITIATION OF INJECTION INTO AGI D #2. BOTTOM HOLE TEMPERATURE HAS NOW GENERALLY STABILIZED AROUND 167 ° F AND AVERAGE BOTTOM HOLE PRESSURE HAS INCREASED ABOUT 100 PSIG IN THREE YEARS.

Figure 5. Zia AGI #1 and D #2 Total Flow Data

INCREASE IN TOTAL FLOW OCCURS AFTER AGI D #2 IS BROUGHT ONLINE IN FEBRUARY 2017 ALLOWING FOR PROCESSING HIGHER VOLUMES OF GAS THROUGH THE PLANT THEN WHEN IT WAS RELYING ON THE AGI #1 WELL ONLY. CURRENT INJECTION RATE HAS INCREASED NEARLY 100% SINCE THIS TIME.

Temperature & pressure gauge set above packer with internal and external measurement at 5,575' MD (5,445' TVD)

Profile Nipple
 300' Corrosion Resistant Alloy (CRA) Casing

Packer at 5,579' MD (5,450' TVD)

OH = 8 1/2"

TD = 6,360' MD (6,195' TVD)

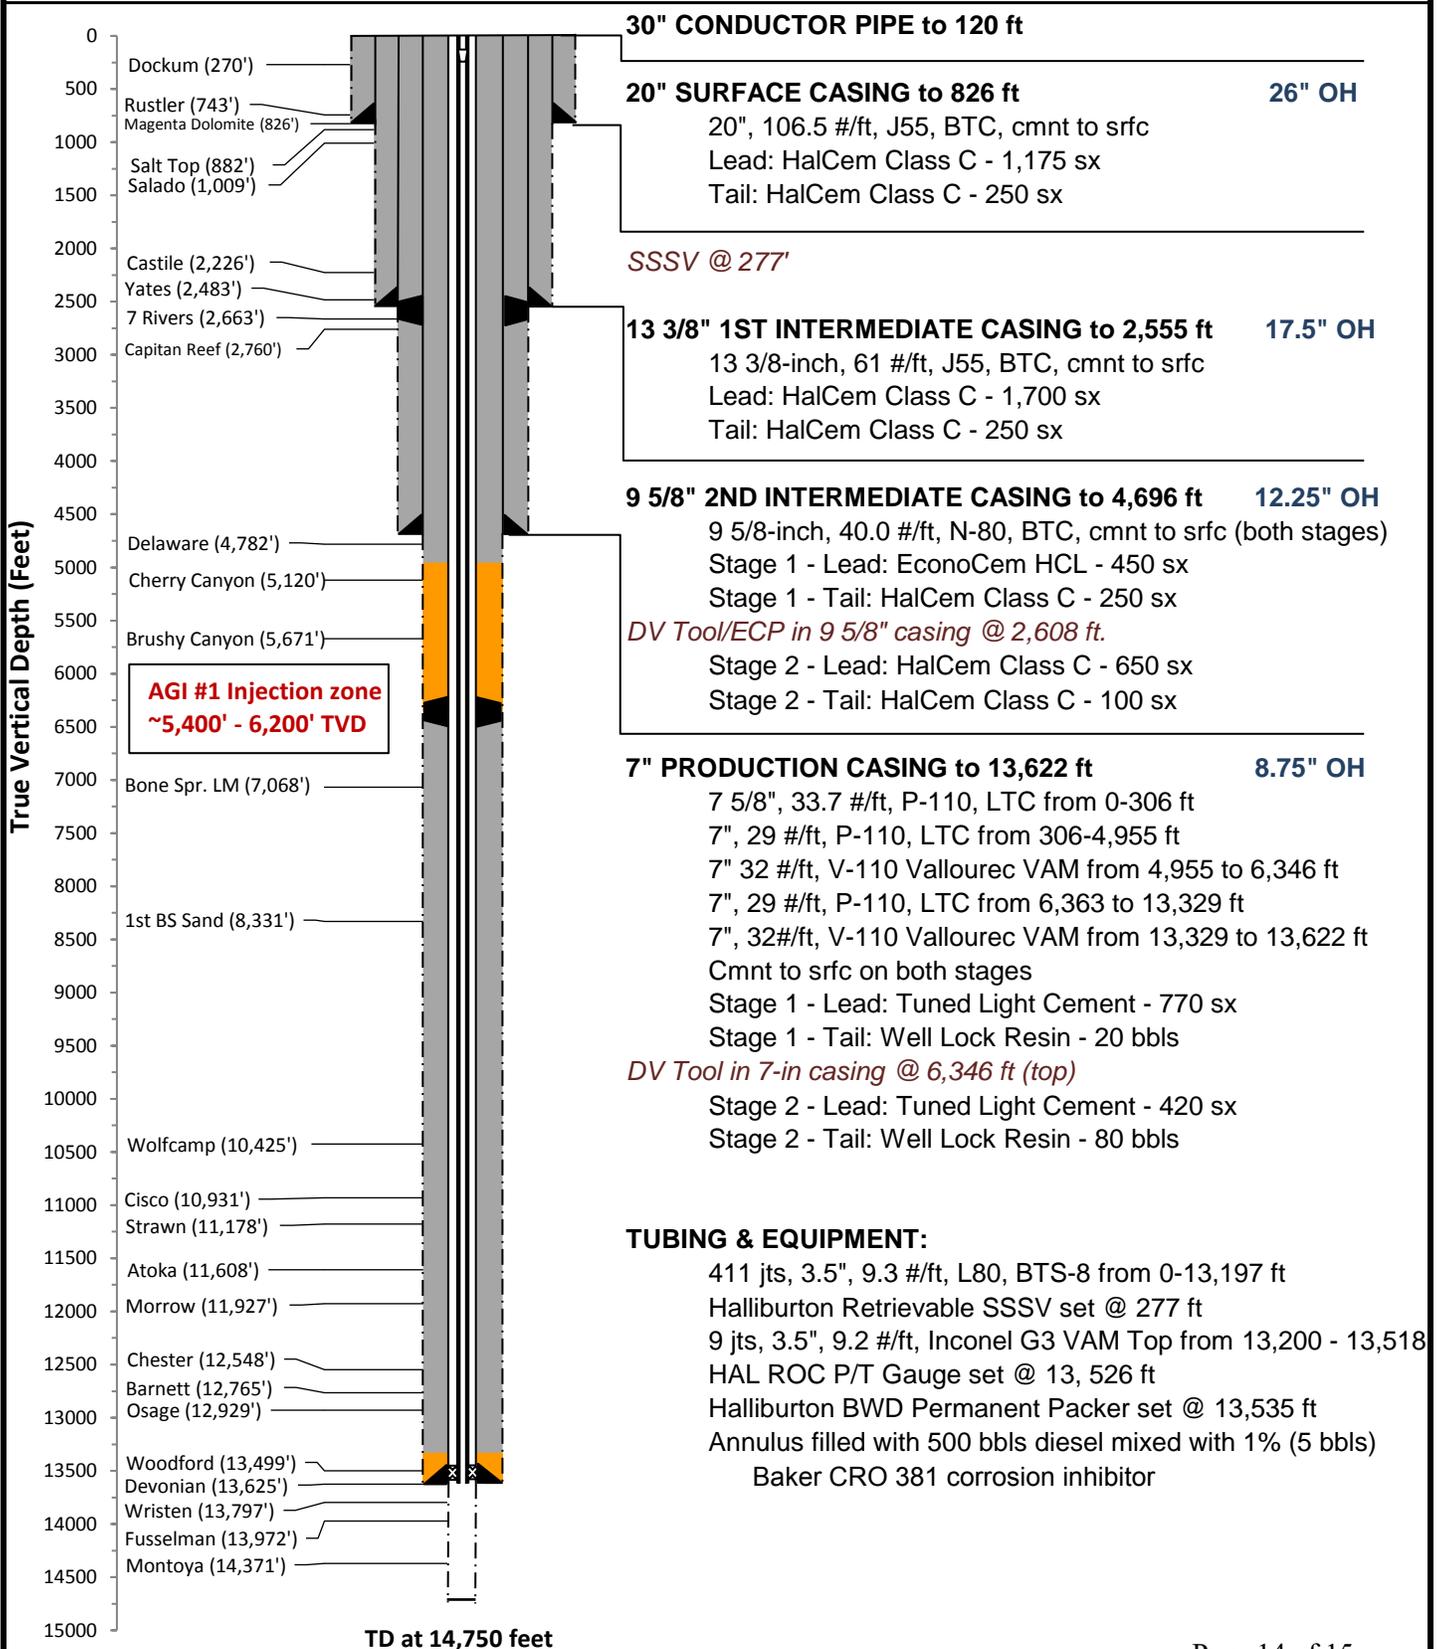

NOT TO SCALE

Bottom Hole Location: Section 19(G), T19S, R32E (2,099' FNL & 862' FWL)

DCP Zia AGI D #2 As-Built Well Schematic

Well Name: Zia AGI D #2
API: 30-025-42207
STR: Sec. 19(L), T19S-R32E
County, St.: Lea County, New Mexico

Footage: 1893' FSL & 950' FWL
Well Type: Devonian AGI Expl.
KB/GL: 3574'/3547'
Lat, Long: 32.643950, -103.777782

Schematic is properly scaled

TD Location: Sec. 19, T19S-R32E (1963' FSL & 1024' FWL)

DCP MIDSTREAM

ZIA AGI #2
LEA COUNTY, NEW MEXICO
1/22/17

Company Rep.
Tool Specialist

GARY HENRICH
SCOTT WALTON
Office ODESSA
SAP No. 903711839
