Rev. 1

Table of Contents

Revision Status

Revision #	Revision Date	Next Review	Change Description
1	05-09-2023	05-09-2025	Complete reformat of the original document last dated 10-27-2022

1. SCOPE

This contingency plan establishes guidelines for the public; all company employees, and contract employees whose work activities may involve exposure to H_2S gas.

The H_2S Contingency Plan must coincide and be compatible with Oxy Onshore Resources Carbon Management (ORCM) – Enhanced Oil Recovery (EOR) Incident Management Plan (IMP).

2. OBJECTIVE

1. Provide an immediate and predetermined response plan to any condition when H_2S is detected. All H_2S detections in excess of 10 parts per million (ppm) concentrations are considered an Emergency.
2. Prevent any and all accidents and prevent the uncontrolled release of H_2S into the atmosphere.
3. Provide proper evacuation procedures to cope with emergencies.

3. DOCUMENT DISCUSSION

Implementation	For new drills, this plan with all details is to be fully implemented before drilling out of the surface shoe or 1000' before the anticipated H_2S zone. For Completions or workovers, it needs to be in place before operations start
Emergency response procedure	This section outlines the conditions and denotes steps to be taken in the event of an emergency.
Emergency equipment procedure	This section outlines the safety and emergency equipment that will be required for the drilling, completion, or workover operations on this well.
Training provisions	This section outlines the training provisions that must be adhered to prior to drilling, completing or working-over
Drilling / Completions emergency call lists	Included are the telephone numbers of all persons to be contacted should an emergency exist.
Briefing	This section deals with the briefing of all people involved in Drilling, Completion, or Well Servicing operation.
Public safety	Public safety personnel will be made aware of any potential evacuation and any additional support needed.
Checklists	Status checklists and procedural checklists have been included to insure adherence to the plan.
General information	A general information section has been included to supply support information.

4. EMERGENCY PROCEDURES

4.1 High H_2S While Operating

In the event of any evidence that H_2S is 10 ppm or higher while operating, personnel (Oxy and contractors) should take the following steps:

1. Begin evacuation procedures and secure well if it is safe to do so.
2. All personnel to report to the designated upwind safe briefing / muster area. If necessary and personnel ae unable to escape safely then don escape breathing equipment if available and proceed to muster area.

3. All personnel on location should be accounted for at the muster area. An emergency search may be conducted only when personnel trained and qualified to do so are available (trained and qualified backup personnel must be in place).
4. Non-essential personnel should be directed to leave the well site.
5. Drill Site Manager (DSM) to call out the H_2S contractor to send H_2S Safety personnel and air trailer (if they are not already on location).
6. The location entrance should be fully secured. The proper condition flag should be displayed at the entrance to the location for drilling locations.
7. All personnel to wait at muster area until the H_2S Safety personnel identifies the area / sensor where H_2S was detected, and if H_2S still is present. The H_2S Safety personnel will also report the level of concentration or if there is a faulty sensor or false alarm.
8. If H_2S is present, then the cascade system should be rigged up (if not already rigged up) and preparations made to work under cascade supplied air.

   If no H_2S is present, the "H_2S All Clear Sign off checklist" should be completed and signed by Rig Manager / Supervisor, DSM, and or H_2S Safety personnel. After signature, all personnel can resume work under normal conditions.
9. Crew / essential personnel may go in and work under cascade supplied air as required after H_2S Safety personnel is on location and cascade system is operational.

NOTE: Self-contained breathing apparatus (SCBA) use is for emergency response or rescue which does include the initial well evaluation and possible shut in if not already shut in; no work will be performed utilizing the SCBA air packs.

4.2 Uncontrollable Conditions

If uncontrollable conditions occur:

1. Take steps to protect and / or remove any public in the down-wind area from the location – partial evacuation and isolation. Notify necessary civil authorities and appropriate regulatory entities (i.e., BLM and Texas railroad commission) of the situation.
2. Remove all personnel to the nearest upwind designated safe briefing / muster area or off location.
3. Notify civil authorities of safe briefing / muster area.
4. An assigned contractor, employee, or civil authority will blockade the entrance to the location. No unauthorized personnel will be allowed entry to the location.
5. Proceed with best plan (at the time) to regain control of the well.

   **Reference the ORCM - EOR Blowout Response Plan

4.3 Responsibility

Designated personnel listed below shall be responsible for the total implementation of this plan and shall be in complete command during any emergency.

All personnel	1. On alarm, will report to the nearest upwind designated safe briefing / muster area. 2. Check status / headcount of personnel. 3. Secure breathing equipment if available and safe to retrieve. 4. Await orders from supervision.
DSM / WSM / WOC	1. Report to nearest upwind designated safe briefing / muster area. 2. Notify and call out H_2S Safety personnel and air trailer if not already on location from the respective contractor. 3. Coordinate preparations of individuals to return to work area when cleared to do so by the H_2S Safety personnel. 4. Assess situation and take control measures as necessary.
Rig Manager / Supervisor	1. Report to up nearest upwind designated safe briefing / muster area. 2. All personnel on location will be accounted for and an emergency search may be conducted only when personnel trained and qualified to do so are available (trained and qualified backup personnel must be in place). 3. Coordinate preparations of individuals to return to work area when cleared to do so by the H_2S supervisor. 4. Assess situation and take control measures if needed. 5. If the DSM is not present the Rig Manager / Supervisor will assume supervision of the event until his return.
Driller / Operator / Line Boss	1. Begin evacuation procedures and secure well if safe to do so 2. Check monitor for point of release if possible. 3. Don escape equipment, if necessary, report to nearest upwind designated safe briefing / muster area. 4. Assist Rig Manager in checking status of personnel. 5. Assign least essential person to notify DSM and toolpusher by quickest means in case of their absence. 6. Assumes the responsibilities of DSM and Rig Manager until they arrive should they be absent.
Derrickman / Floorman / Equipment Operators	Remain in briefing / muster area until instructed by supervisor.
Mud engineer	1. Report to nearest upwind designated safe briefing / muster area. 2. When instructed, begin check of mud for pH and H_2S level. (Garett gas train)
H_2S Safety personnel	Identify the area / alarm where H_2S was detected, and if H_2S still present at what level of concentration or if faulty sensor or false alarm.

5. GENERAL EVACUATION PLAN

When the site supervision determines the H_2S gas cannot be limited to the well location and the public will be involved, they will activate the Incident Management Plan (See ORCM EOR IMP).

6. EMERGENCY RESPONSE DRILLS

Muster drills should be conducted, at the work site, by each crew on a weekly basis. The drills should consist of a dry-run performance of personnel roles and responsibilities related to each assigned job.

Each drill should be critiqued by OXY DSM and any new considerations documented. The results should be communicated to the HSE Department, OXY and Contractor line management and all affected personnel, including Field and Office Superintendents. Records of each drill and a critique summary should be sent to the HSE Department for review if deemed necessary by the Drilling & Completions Manager.

7. TRAINING REQUIREMENTS

When working in an area where H_2S gas is expected, pre-job training requirements must be carried out. All companies will ensure that all essential personnel at the well site will have had adequate training in the following:

1. Hazards and characteristics of H_2S.
2. Physical effects of H_2S on the human body.
3. Toxicity of H_2S and sulfur dioxide.
4. H_2S detection.
5. Use of SCBA and supplied air equipment if expected to don and use the equipment
6. An adequate number of trained personnel in first aid and cardiopulmonary resuscitation (CPR).

8. SERVICE COMPANY AND VISITING PERSONNEL PRECAUTIONS

Each service company and visitor will be expected to attend a well site briefing / orientation upon arrival.

Each service company must equip and train their personnel on the use and capabilities with an H_2S monitor which is intrinsically safe, and capable of sensing a minimum H_2S concentration of 10 ppm. These devices are to be electronic, and capable of emitting a visual and audible alarm.

Visitors who are not equipped with personal H_2S monitors must be escorted by somebody equipped with a properly calibrated personal H_2S monitor with the approval of the functional superintendent.

9. EMERGENCY EQUIPMENT REQUIREMENTS

9.1 Minimum Emergency Equipment for Drilling Rigs

1. 1 sign at the location entrance with the following language:
   Caution – Potential Poison Gas
   Hydrogen Sulfide (H_2S)
   No Admittance Without Authorization
2. Windsocks
   - One 36” length windsock at the center of location visible from the rig floor
   - One 36” length windsock visible from the pit areas
   - One windsock located at the primary and secondary muster areas

3. H_2S sensors and alarms
   Safety contractor is to visually inspect and test the sensors and alarms on a weekly basis after rigging up
   i. Five (5) H_2S Sensors
      - 1 between the reserve pit and rig at the generator side corner of the reserve pit
      - 1 at the shakers and trip tank or mud return line receiver tank
      - 3 at the rig floor and substructure:
        – 1 on rig floor driller side inside the derrick leg
        – 1 at bell nipple or beneath the rotary table adjacent to the flow line
        – 1 on substructure leg at draw-works side base of Blowout Preventor (BOP)

   ii. Five (5) Audio / Visual alarms
      - 1 audible alarm near the mud pumps facing the rig floor
      - 1 visual alarm on the A-leg side of the driller shack facing the driller
      - 1 audible alarm on the A-leg side of the driller shack facing the driller
      - 1 visual alarm in the generator house
      - 1 audio/visual control panel in the driller cabin
4. H_2S condition flags shall be displayed at the front gate with color indication of severity of H_2S.
5. Mud inspection devices:
   - Garrett gas train or hatch tester for inspection of sulfide concentration in mud system.
6. Adequate fire extinguishers shall be located at strategic locations
7. Hydraulic BOP equipment with a remote control that is rated for the anticipated pressures. Equipment is to be tested on installation and as required thereafter.
8. Gas buster equipment shall be installed before drilling out of surface.
9. 1 combustible gas detector on location at all times.
10. Radio / cell telephone communication at the rig (i.e., rig floor, trailer, vehicle, etc.).
11. Special control equipment such as a rotating head will be used as required.
12. An evacuation plan with evacuation routes should be established prior to well spud for each well and discussed with all personnel on location.
13. Designated areas will be maintained:
    - Parking and visitor area – all vehicles are to be parked at a predetermined safe distance from the wellhead with the first movement forward and toward the exit when possible.
    - A designated smoking area.
    - Two briefing / muster areas on opposite sides of the location – at the maximum allowable distance from the well bore to offset prevailing winds perpendicularly or at a 45-degree angle if wind direction tends to shift in the area.

9.2 Use of SCBA

All SCBAs shall be fitted with positive pressure demand regulators and shall conform to a recognized oil and gas industry standard, such as US National Institute of Occupational Safety and Health (NIOSH) or equivalent.

SCBAs shall be inspected monthly to ensure that they are properly stored, cleaned, maintained and ready for use, as per the manufacturer recommendation or as conditions warrant. Maintenance will be performed by qualified personnel certified by the manufacturer of the equipment, shall be responsible for the safe and efficient operation of the system and shall regularly maintain the system in its entirety as per Occupational Safety and Health

Administration (OSHA) 29 Code of Federal Regulation (CFR) 1910.134, Compressed Gas Association (CGA) 7.0 and 7.1.

Anyone who may use the SCBAs shall be trained in the use of that specific equipment. **Note:** Items as facial hair (i.e., beard, sideburns, etc.) and eyeglasses will not allow proper seal. Anyone that may be reasonably expected to wear SCBAs should have these items removed before entering a toxic atmosphere. A special mask must be obtained for anyone who must wear eyeglasses or contact lenses.

Persons assigned a task that requires use of SCBA shall be medically cleared and have a current fit test for the breathing equipment in use.

SCBAs should be worn:

1. While sampling air to determine if toxic concentrations of H_2S exist.
2. While entering areas where over 10 ppm H_2S has been detected.
3. Any time there is a doubt as to the H_2S level in the area to be entered.

9.3 Rescue

Oxy does not have the expectation for employees to perform rescue in an H_2S release situation. Rescue activities may be carried out by trained and certified personnel from a contracted safety company.

10. TOXIC EFFECTS OF H_2S

H_2S is extremely toxic. The acceptable ceiling concentration for eight-hour exposure is 10 ppm, which is .001% by volume. H_2S is heavier than air (specific gravity – 1.192) and colorless. It forms an explosive mixture with air between 4.3 and 46.0 percent by volume. H_2S is almost as toxic as hydrogen cyanide and is between five and six times more toxic than carbon monoxide. The principal hazard of H_2S inhalation is death caused by paralysis of the respiratory system. The inhaled gas is absorbed into the bloodstream and is then carried to the brain where it affects the respiratory nerve center. Other symptoms of H_2S exposure include headaches, dizziness, drowsiness, increased heart rate, and nausea, with severity being determined by the amount of exposure. Coughing and pain in the eyes, throat, and chest may be attributed to the formation of acid formed when H_2S comes into contact with the moist surfaces of body tissue. Toxicity data for H_2S and various other gases are compared in Table 1. Physical effects at various H_2S exposure levels are shown in Table 2.

10.1 Table 1 – Toxicity of various gases

Common name	Chemical formula	Threshold limit (1)	Hazardous limit (2)	Lethal concentration (3)
Hydrogen Cyanide	HCn	10 ppm	150 ppm/hr	300 ppm
Hydrogen Sulfide	H_2S	10 ppm	250 ppm/hr	600 ppm
Sulfur Dioxide	SO_2	5 ppm	-	1000 ppm
Chlorine	Cl_2	1 ppm	4 ppm/hr	1000 ppm
Carbon Monoxide	CO	50 ppm	400 ppm/hr	1000 ppm
Carbon Dioxide	CO_2	5000 ppm	5%	10%
Methane	Ch_4	90,000 ppm	Combustible above 5% in air	

1) Threshold limit – concentration at which it is believed that all workers may be repeatedly exposed day after day without adverse effects.
2) Hazardous limit – concentration that will cause death with short-term exposure.
3) Lethal concentration – concentration that will cause death with short-term exposure.

10.2 Table 2 – Physical effects of H_2S

Percent (%)	ppm	Grains (100 gr/ft^3)*	Physical effects
0.001	<10	00.65	Obvious and unpleasant odor.
0.002	10	01.30	Safe for 8 hours of exposure.
0.010	100	06.48	Kill smell in 3 – 15 minutes. May sting eyes and throat.
0.020	200	12.96	Kills smell shortly; stings eyes and throat.
0.050	500	32.96	Dizziness; breathing ceases in a few minutes; needs prompt artificial respiration.
0.070	700	45.36	Unconscious quickly; death will result if not rescued promptly.
0.100	1000	64.30	Unconscious at once; followed by death within minutes.

*at 15.00 psia and 60'f

11. WEEKLY REQUIREMENTS LIST

Each of the following shall be performed each week:

1. Safety contractor will check each piece of the breathing equipment to make sure that demand or forced air regulator is working. This requires that the bottle be opened, and the mask assembly donned so that when you inhale you receive air or feel air flow. The mask shall be sized in accordance with the person's fit test for the particular mask.
2. Safety contractor will check the mask assembly to see that straps are loosened and turned back so that it is ready to don.
3. Safety contractor will check the pressure on all air bottles (active and spares) to make sure they are charged to full volume. Air quality shall be checked for proper air grade (breathing air – Grade D) before the bottles are brought to location.
4. BOP skills (well control / muster drills) will be tested weekly.
5. Supply pressure on BOP accumulator stand will be checked weekly.

12. ATTACHMENTS

CONDITIONS

Action 342129

CONDITIONS

Operator: OCCIDENTAL PERMIAN LTD P.O. Box 4294 Houston, TX 772104294	OGRID: 157984
	Action Number: 342129
	Action Type: [C-101] Drilling Non-Federal/Indian (APD)

CONDITIONS

Created By	Condition	Condition Date
pkautz	Notify OCD 24 hours prior to casing & cement	5/29/2024
pkautz	Will require a File As Drilled C-102 and a Directional Survey with the C-104	5/29/2024
pkautz	Once the well is spud, to prevent ground water contamination through whole or partial conduits from the surface, the operator shall drill without interruption through the fresh water zone or zones and shall immediately set in cement the water protection string	5/29/2024
pkautz	Oil base muds are not to be used until fresh water zones are cased and cemented providing isolation from the oil or diesel. This includes synthetic oils. Oil based mud, drilling fluids and solids must be contained in a steel closed loop system	5/29/2024
pkautz	Cement is required to circulate on both surface and production strings of casing	5/29/2024
pkautz	If cement does not circulate on any string, a CBL is required for that string of casing	5/29/2024
pkautz	The Operator is to notify NMOCD by sundry (Form C-103) within ten (10) days of the well being spud	5/29/2024
pkautz	MUST COMPLY WITH ALL COA'S IN ADMINISTRATIVE ORDER PMX-347	5/29/2024
