The mechanical integrity test (MIT) was conducted on Thursday, January 16, 2025. Barbara Lydick (NMOCD) was on-site to oversee and approve the MIT and bradenhead test (BHT). Below is a step-by-step summary of the results:

- The annular space pressure between the production casing and tubing was 0 psi prior to the start of the MIT; treated acid gas (TAG) was being injected into the tubing at 490 psi but increased to 540 psi during the MIT.
- Lines from the brine pump truck and a calibrated chart recorder were attached to the annular space well valve to record the pressure changes. The annular pressure was bled to 0 psi and at 9:45 am (MT) the recorder was started.
- At 9:49 am brine was slowly added from the pump truck to achieve the beginning test pressure. The well and chart recorder were then isolated from the truck.
- The MIT began at 9:51 am with the annulus pressure at 600 psi.
- The chart recorded the annular pressure until 10:25 am (34 minutes). Brine was then bled back to 0 psi and the chart was removed from the recorder. An operating pressure of 300 psi was then added to the annular space.
- During the test, the annular pressure increased to 610 psi (an increase of 10 psi or 1.6%) with no change over the final 20 minutes. The surface casing annular pressure, monitored with a gauge in the cellar, also remained unchanged (0 psi) throughout the MIT.

The MIT pressure chart, BHT documentation, and chart recorder calibration sheet are attached.

I hereby certify that the information above is true and complete to the best of my knowledge and belief.
