*Downhole Commingling Request
N.M. "V" State #6
Lea County, New Mexico*

*New Mexico Oil Conservation Division
P. O. Box 2088
Santa Fe, New Mexico 87501*

ATTENTION: Mr. David Catanach

Gentlemen:

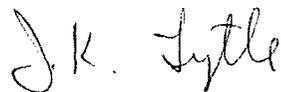

Exxon respectfully requests NMOCD approval to downhole commingle the Blinebry and Drinkard formations in the N.M. "V" State #6. Permission to dually complete this well was authorized by administrative order MC-1403. If permission to downhole commingle is received, this well will be placed on sucker rod pump to effectively lift formation fluids from the wellbore resulting in increased flow rates, and increase ultimate recovery from these two oil zones.

The Blinebry quit flowing in 1974 and the Drinkard quit flowing in 1979. Both zones have 2000'-3000' of fluid on the formation face. Downhole commingling will enable Exxon to place the well on sucker rod pump to remove the formation fluids at an economical rate. If downhole commingling is not approved, one of the zones will be squeezed and the other will be placed on sucker rod pump. It is doubtful that it would be economical to re-enter the squeezed zone in the future due to the low potential. Downhole commingling is being requested to prevent this waste.

The Blinebry and Drinkard zones currently satisfy the requirements necessary to apply for downhole commingling (see Attachment 1). The items Exxon must submit to the Commission to obtain approval are listed on Attachment 2, and subsequent attachments contain the data noted in Attachments 1 and 2.

Please contact J. W. Jordan (915) 523-3650 if any further information is required.

Yours truly,

A handwritten signature in cursive script that reads "J. K. Lytle". The letters are fluid and connected, with a prominent loop on the "L".

J. K. Lytle

c: Offset Operators (Certified Mail)
District I - NMOCD, Hobbs, NM

ATTACHMENT 1

N. M. "V" State #6 - Downhole Commingling - Requirements

The Blinebry and Drinkard formations in the above well satisfy the requirements necessary for downhole commingling as follows:

1. The total combined daily oil production from the oil zones before commingling does not exceed 40 BOPD. Currently neither zone is able to flow. 6608' is the depth of the bottom perforation in the Drinkard formation.
2. Oil zones require artificial lift, or, both zones are capable of flowing. Both zones now require artificial lift, which will be installed when the two zones are commingled.
3. Neither zone produces more than 40 BWPD. Neither zone is now able to flow.
4. The fluids from each zone are compatible with the fluids from the other, and combining the fluids will not result in the formation of precipitates which damage either reservoir. See attached data.
5. The total value of the crude will not be reduced by commingling. See attached data.
6. Ownership of the zones to be commingled is common (including working interest, royalty, and overriding royalty).
7. The commingling will not jeopardize the efficiency of present or future secondary recovery operations in either of the zones to be commingled. Current plans are to commingle these zones for waterflood in the proposed Blinebry-Drinkard Waterflood Unit.
8. The commingling is necessary to permit a zone or zones to be produced which would not otherwise be economically producible.
9. There will be no crossflow between zones to be commingled.
10. The bottomhole pressure of the lower pressure zone is not less than 50 percent of the bottomhole pressure of the higher pressure zone adjusted to a common datum. See attached data.

ATTACHMENT 2

N. M. "V" State #6 - Downhole Commingling - Data Required

To obtain approval for downhole commingling, we have enclosed the following data pursuant to Rule 303(C)(2)(a through j):

1. Exxon's name and address:

Exxon Corporation
1700 West Broadway
Andrews, TX 79714

2. Lease name, well number, well location, and name of pools to be commingled:

New Mexico "V" State No. 6, 1980' FSL, 1980' FEL, Section 10, T-21-S, R-37-E, Lea County, New Mexico. Pools to be commingled: Blinebry and Drinkard. Authorization to dually complete-Order No. MC-1403.

3. A plat of the area showing the acreage dedicated to the well and the ownership of all offsetting leases: Attached.

4. A 24-hour productivity test on Division Form C-116 showing the amount of oil, gas, and water produced from each zone: Attached.

5. A production decline curve for both zones showing that for a period of at least one year, a steady rate of decline has been established for each zone which will permit a reasonable allocation of the commingled production to each zone for statistical purposes: Attached.

6. Current bottomhole pressure for each zone capable of flowing:

Measured BHP - Drinkard 615 psig. Estimated BHP - Blinebry 926 psig, based on measured BHP's in the N. M. "V" State #'s 7 and 8, direct offsets. Common datum - mid perms of Blinebry (5782').

BHP Bomb data are attached.

7. A description of the fluid characteristics of each zone showing that the fluids will not be incompatible in the wellbore:

See attached hydrocarbon analysis. The Blinebry gas analysis is from the N. M. "V" State #3, a direct offset. Exxon has commingled these fluids at the surface and has encountered no incompatibility problems.

8. A computation showing that the value of the commingled production will not be less than the sum of the values of the individual streams: Attached.

9. A formula for the allocation of production to each of the commingled zones and a description of the factors or data used in determining such a formula:

$$\text{Blinebry Pool: Oil Allocation} = \left[\frac{21e^{-(0.4176)t}}{11e^{-(0.5682)t}} + 1 \right]^{-1} = 0.0792$$

$$\text{Gas Allocation} = \left[\frac{100e^{-(0.1189)t}}{140e^{-(0.2036)t}} + 1 \right]^{-1} = 0.3363$$

Where t = time between January 1, 1974 and January 1, 1986 = 12 years.

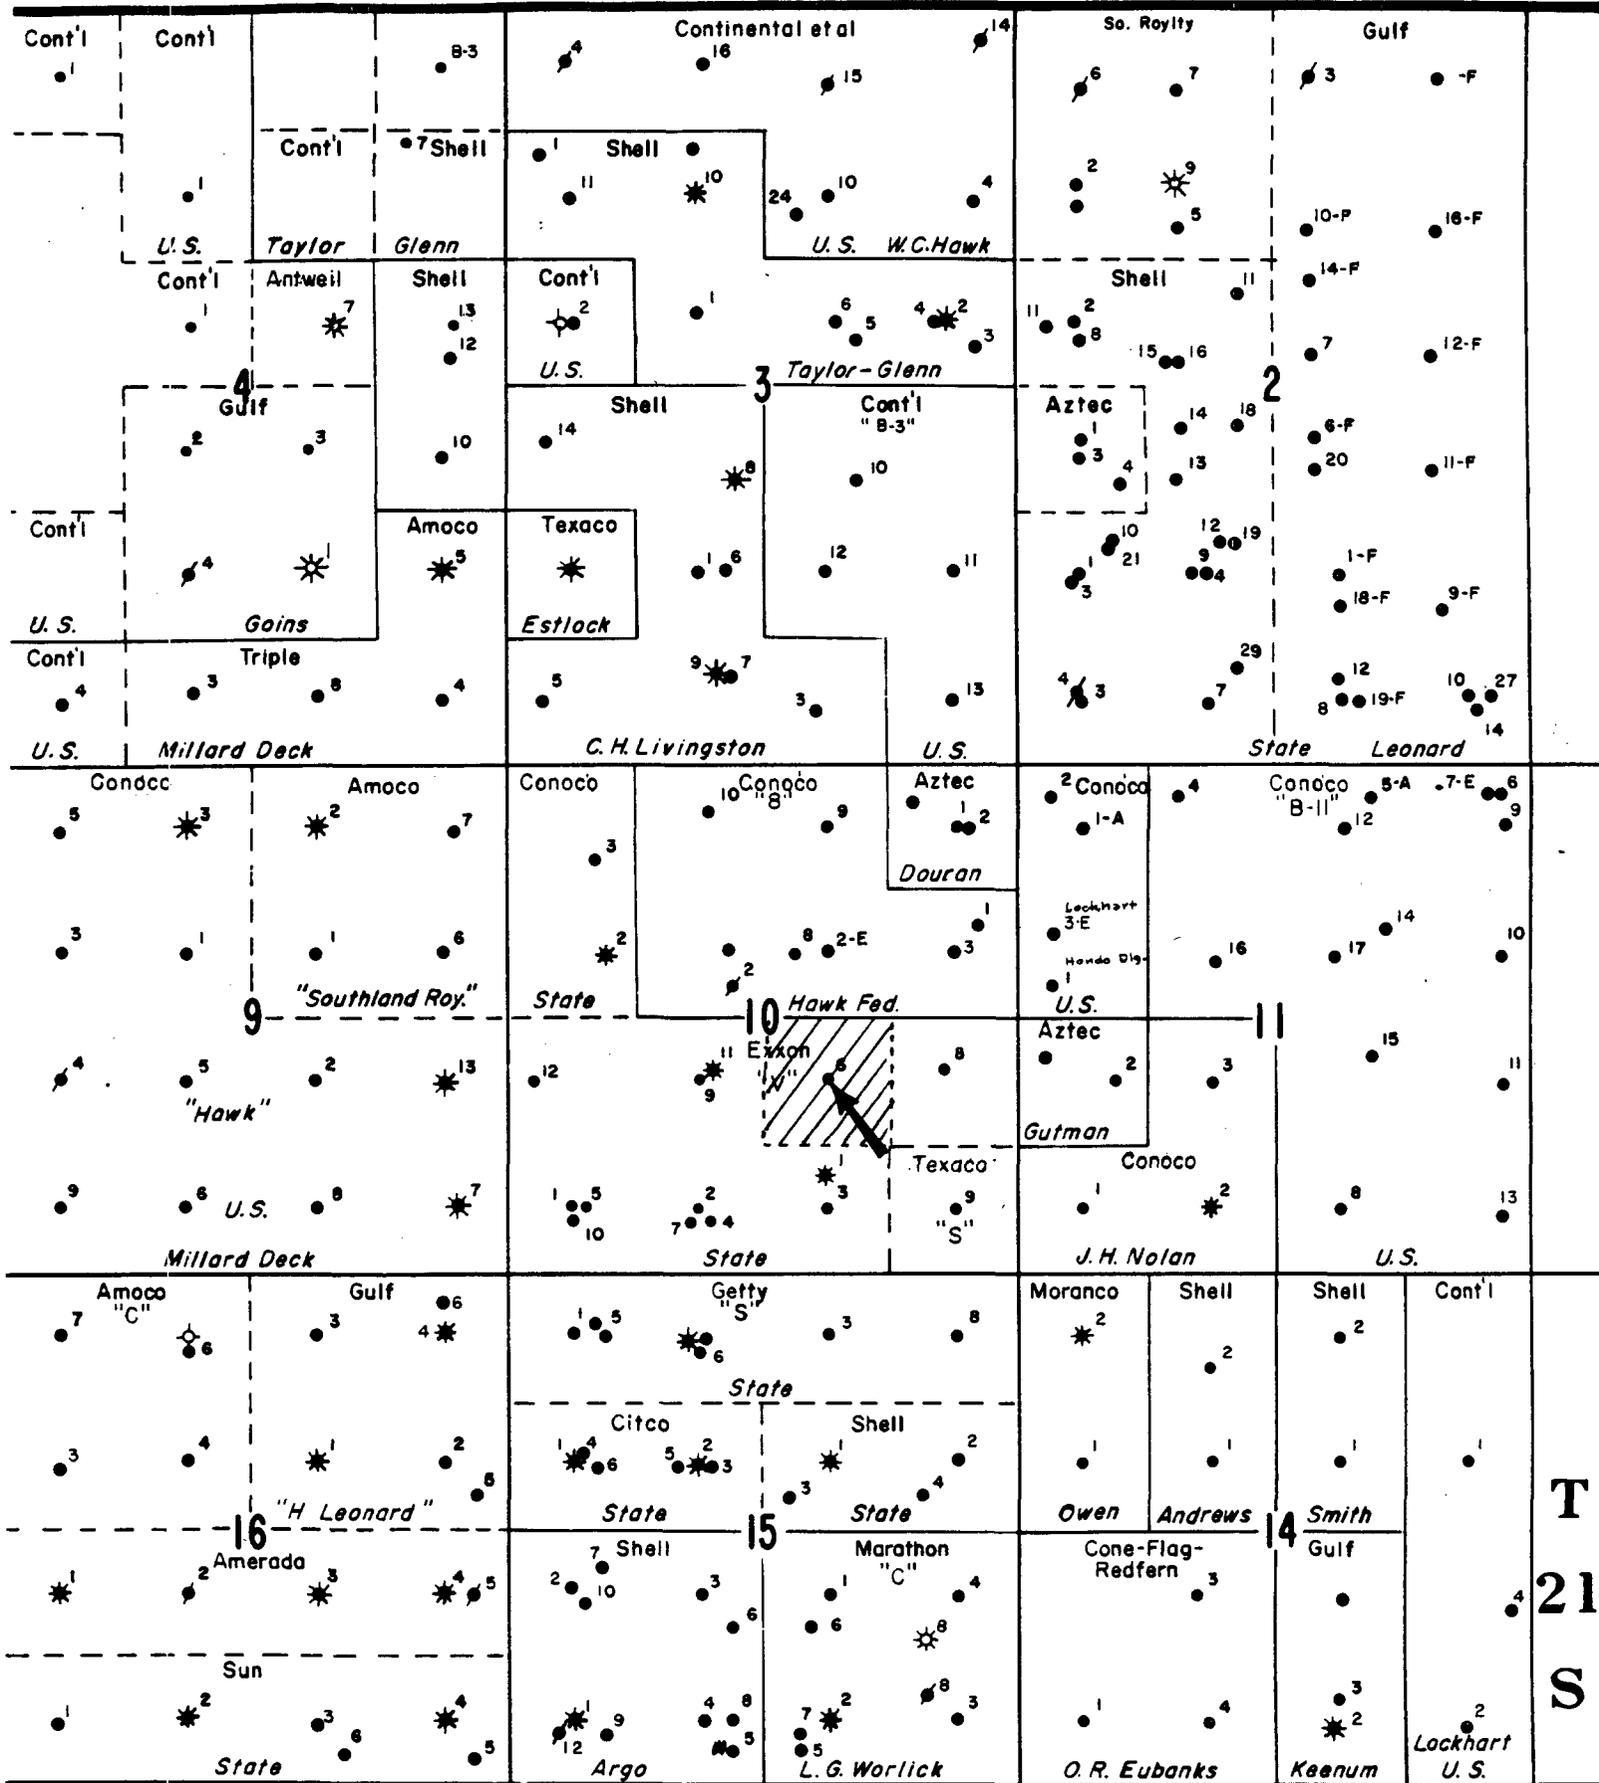

Drinkard Pool: Oil Allocation = 1 - Blinebry Oil Allocation = 0.9208
 Gas Allocation = 1 - Blinebry Gas Allocation = 0.6637

Computations of the production allocations to each zone are attached.

10. A statement that all offset operators and, in case of a well on Federal land, the United States Geological Survey, has been notified in writing of the proposed commingling:

The names and address of all offset operators have been provided.

Estimated Effects on the Value of
Total Production from Proposed
Down Hole Commingling¹

New Mexico "V" State #6

Before Down Hole Commingling

	<u>BPD Oil Volume</u>	<u>Oil Price</u>	<u>MCF/Day Gas Volume</u>	<u>Gas Price</u>	<u>Daily Oil and Gas Value</u>
Blinbry	0	N/A	0	N/A	0
Drinkard	0	N/A	0	N/A	0
					<u>\$0</u>

After Down Hole Commingling

	<u>BPD Oil Volume</u>	<u>Oil Price</u>	<u>MCF/Day Gas Volume</u>	<u>Gas² Price</u>	<u>Daily Oil And Gas Value</u>	<u>Difference in Daily Value</u>
	60	27.86	600	.84	<u>2175.60</u>	
					<u>\$2175.60</u>	<u>\$2175.60</u>

1. Production volumes and prices based on September 1985 data
2. If gas split between two purchasers-assumed lower price prevails after commingling.

Allocation of Oil Production To Each Zone

Equations Used:

Decline Rates (1) $q = q_i e^{-a t}$

(2) $a_n = \frac{\ln (q_i/q)}{t}$

a_n = nominal decline, per yr.
 q_i = initial rate, kcf/Day
 q = later rates, kcf/Day
 t = time between rates, yrs.

Decline Rate Computations:

Blinebry Zone

$q_i = 11$ BOPD
 $q = 2$ BOPD
 $t = 3$ years

$a_n = \frac{\ln (11/2)}{3}$

a_n (Blinebry) = 0.5682/yr

Drinkard Zone

$q_i = 21$ BOPD
 $q = 6$ BOPD
 $t = 3$ years

$a_n = \frac{\ln (21/6)}{3}$

a_n (Drinkard) = 0.4176/yr

Actual Allocations:

x_b = Blinebry Allocation, fraction.
 x_d = Drinkard Allocation, fraction.
 q_b = Blinebry rate, BOPD.
 q_d = Drinkard rate, BOPD.
 q_{bi} = Blinebry initial rate, BOPD.
 q_{di} = Drinkard initial rate, BOPD.

$x_b = \frac{q_b}{q_d + q_b}$

Substituting eq. (1)

$x_b = \frac{q_{bi} e^{-a_b t}}{q_{di} e^{-a_d t} + q_{bi} e^{-a_b t}} = \left[\frac{q_{di} e^{-a_d t}}{q_{bi} e^{-a_b t}} + 1 \right]^{-1}$

$q_{bi} = 11$ BOPD
 a_n (Blinebry) = 0.5682/yr.

$q_{di} = 21$ BOPD
 a_n (Drinkard) = 0.4176/yr.

$x_b = \left[\frac{21 e^{-(0.4176)t}}{11 e^{-(0.5682)t}} + 1 \right]^{-1}$

$x_d = 1 - x_b$

Where t = time between January, 1976 and current date, years.

Allocation Of Gas Production To Each Zone

Decline rate computations:

Blinebry Zone

$$\begin{aligned}q_i &= 140 \text{ kcf/Day} \\q &= 76 \text{ kcf/Day} \\t &= 3 \text{ years}\end{aligned}$$

$$\begin{aligned}a_n &= \frac{\ln (140/76)}{3} \\a_n \text{ (Blinebry)} &= 0.2036/\text{yr.}\end{aligned}$$

Drinkard Zone

$$\begin{aligned}q_i &= 100 \text{ kcf/Day} \\q &= 70 \text{ kcf/Day} \\t &= 3 \text{ years}\end{aligned}$$

$$\begin{aligned}a_n &= \frac{\ln (100/70)}{3} \\a_n \text{ (Drinkard)} &= 0.1189/\text{yr.}\end{aligned}$$

Actual Allocation:

$$\begin{aligned}q_{bi} &= 140 \text{ kCF/Day} \\a_n \text{ (Blinebry)} &= 0.2036/\text{yr.}\end{aligned}$$

$$\begin{aligned}q_{di} &= 100 \text{ kCF/Day} \\a_n &= 0.1189/\text{yr.}\end{aligned}$$

$$\begin{aligned}x_b &= \left[\frac{q_{di} e^{-a_d t}}{q_{bi} e^{-a_b t}} + 1 \right]^{-1} \\x_b &= \left[\frac{100 e^{-(0.1189)t}}{140 e^{-(0.2036)t}} + 1 \right]^{-1} \\x_d &= 1 - x_b\end{aligned}$$

Where t = time between January 1, 1974 and current date, years.

Gentlemen:

I have examined the application for the:

Exxon Corp.	New Mexico V State	No. 6-J	10-21-37
Operator	Lease & Well No.	Unit	S-T-R

and my recommendations are as follows:

All the application was not sent to us as the decline curve quit in '79.--J.S.

Yours very truly,

Jerry Sexton
