RE: Plains Pipeline, L.P. C. S. Cayler Release Site
NMOCD Reference # AP-052
Unit Letter B of Section 6, Township 17 South, Range 37 East
Lea County, New Mexico

Dear Mr. Hansen:

Plains Pipeline, L.P. is pleased to submit the attached Field Activity Report, dated June 21, 2011, for the C.S. Cayler release site located in Section 6 of Township 17 South, and Range 37 East of Lea County, New Mexico. This document summarizes the recent activities performed at the site related to the installation of monitor wells and the plugging and abandonment of monitor wells.

Should you have any questions or comments, please contact me at (575) 441-1099.

Sincerely,

Jason Henry
Remediation Coordinator
Plains Pipeline, L.P.

1.0 INTRODUCTION AND OBJECTIVES

1.1 Objectives and Site Background

The C.S. Cayler (site) is located approximately seven (7) miles southeast of Lovington, Lea County, New Mexico, on property owned by Robert C. Rice. There are no residences, groundwater supply wells, or surface water bodies within a 1,000-foot radius of the site. The initial release occurred from an EOTT Energy (EOTT) steel pipeline on September 19, 2002. Subsequently, EOTT changed its name to Link Energy in October 2003, and Plains Marketing, L.P. (Plains) purchased the assets of Link Energy on April 1, 2004. Initial reports estimated that 70 barrels (bbls) of crude oil were released. During site reconnaissance, it was observed that the ground surface beyond the current spill area had apparently been impacted by a prior spill or spills; however, the source(s) and date(s) of the spill are unknown. Based on available information, no crude oil was initially recovered at the release site.

The site is situated in a physiogeographic area that is on the extreme south-western portion of the Southern High Plains as it grades into the Edwards Plateau to the south and southeast and the Chihuahuan Desert of the Trans-Pecos Region to the southwest.

The topography proximal to the site is typical of the Southern High Plains, which is essentially flat with shallow depressions, or playa lakes, dotting the landscape. The prominent surface features on the Southern High Plains are the approximately 19,250 ephemeral playa lakes; however the density of the playa lakes diminishes toward the southern extent of the Southern High Plains. During periods of rainfall, the playas accumulate sheet runoff from watershed areas ranging in size from less than one square mile to several square miles. Only a small portion of drainage from rainfall occurs by streams. Playa lakes that collect storm water runoff can act as a recharge mechanism for groundwater.

The average elevation of the site area is approximately 3,810-feet above mean sea level with a slight slope to the southeast. The regional slope of the land surface in the Southern High Plains is approximately 100 feet per mile in a southeasterly direction.

On February 5, 2007, Talon/LPE (Talon) was retained by Plains to assume remediation activities at the site. Remediation activities at the site were previously conducted by Environmental Plus, Inc. (EPI).

1.2 Site Geology

The surface deposits in Lea County are composed of Blackwater Draw (Illinoian) sediments, Ogallala sediments and undivided Quaternary alluvium, which is also termed 'cover sands'. The soil in the upper two (2) feet at the site composed of gravelly loam that consists of 43% sand, 18% clay and 40% silt and also contains abundant eroded gravel to cobble size caliche fragments. Below the top soil is predominately unconsolidated sand to weakly cemented sandstone which has undergone calcification of varying extent.

Below the Blackwater Draw Formation is the Ogallala Formation of Miocene to Pliocene age. The Ogallala Formation was deposited from sediments eroded from the Southern Rockies and

consists mostly of eolian sediments, silty to very fine sand or loess. During the middle to late Miocene, the Ogallala was deposited by fluvial mechanism as paleovalley fill composed of gravelly to sandy braided stream deposits that trended west to east across the Southern High Plains. During the late Miocene the west to east drainage was diverted (captured) by the Pecos River. Subsequently, the Pecos River basin has experienced deflation, which facilitated eolian deposition on the Southern High Plains during the Pliocene.

1.3 Previous Monitor Well Installations

A total of twenty-three groundwater monitor wells have been installed at the Cayler site to date and three monitor wells have been plugged and abandoned (see Figure 1). With New Mexico Oil Conservation Division (NMOCD) approval and landowner concurrence, groundwater monitor well MW-1 was installed in October 2002, which was subsequently plugged in September 2008 due to the well being dry. Groundwater monitor wells MW-2, MW-3, MW-4, and MW-5 were installed from May to June 2004, and MW-6, MW-7, MW-8, MW-9, and MW-10 were installed in October 2004. Groundwater monitor wells MW-11, MW-12, MW-13, MW-14, MW-15, MW-16, and MW-17 were installed in February 2006, and MW-18 was installed in March 2008. Replacement monitor well MW-1A was installed in September 2008.

1.4 Physical Characteristics of the Water-Bearing Zone

The primary groundwater resource under the Southern High Plains, including the subject site, is referred to as the Ogallala Aquifer or High Plains Aquifer. The Southern portion of the Ogallala aquifer underlies an area of about 29,000 square miles (mi²) in western Texas and eastern New Mexico, encompassing all or part of 31 counties in Texas and six (6) counties in New Mexico.

The Ogallala Aquifer has experienced acute depletion from extensive irrigation and urban demand, which have exceeded the average annual recharge rate. Recharge of the Ogallala Aquifer on the Southern High Plains occurs predominately from rainfall runoff that accumulates in ephemeral streams and playa lakes as well as direct recharge in areas that contain permeable soils such as sand hills. Recharge rates vary depending on mechanism, but averages from 0 to 1.6 inches per year.

The Ogallala Aquifer is generally unconfined and the potentiometric surface generally mirrors the land surface elevation with the regional flow direction from the northwest to the southeast. The mean regional gradient is 15 feet per mile and the typical groundwater velocity averages seven (7) inches per day. The regional hydraulic conductivity averages 17 gallons per day per square-foot and specific yield averages 16%. The depth to groundwater at the site has historically ranged from 80 to 85 feet below ground surface (bgs) and the groundwater flow direction is to the southeast at an average of five (5) feet per mile. The saturated thickness of the Ogallala formation in the Lea County area ranges from 50 feet to 100 feet. The variable thickness is due to the irregularly eroded Triassic surface that underlies the Ogallala.

The composition of Ogallala groundwater is defined as mixed-cation-HCO₃, therefore, Ogallala groundwater is considered hard. Problems with scale have occurred with residential and commercial water systems that use Ogallala groundwater and often treatment strategies are employed to reduce the effects of scale. The typical total dissolved solids of Ogallala groundwater in the Hobbs-Lovington area is generally less than 500 mg/L (ppm) in areas not

impacted by oil-field brines. The pH of Ogallala water in the Lea County area averages 7.3.

2.0 SITE ACTIVITIES

The sections that follow summarize the installation procedures for the four (4) replacement monitor wells at the site (MW-2A, MW-7A, MW-8A, and MW-12A). Groundwater levels at the site have declined an average of 11 feet since groundwater measurements were first obtained in 2002. Monitor wells MW-7 has not detected groundwater since the gauging event on 9/21/10 and monitor well MW-8 has not detect groundwater since the gauging event on 6/10/09. Monitor well MW-2 measured a total depth (TD) of 88 feet below top of casing (btoc) and contained approximately five (5) ft of PSH and groundwater was not detected during the gauging event on 3/23/11. Monitor well MW-12 measured a TD of 90 feet btoc and the gauging event on 3/25/11 indicated approximately five (5) feet of PSH and groundwater at TD.

Gauging data for the four (4) newly installed monitor wells is located in Table 1 in Appendix B.

2.1 Monitor Well Installation

Monitor well installation was performed by Talon Drilling Co. under the supervision of Talon Geologists, John Franklin and Steven R. Killingsworth, P.G. Talon Drilling Co. is licensed (No. 1575) to operate in the State of New Mexico. Talon drilling and supervisory staff personnel are safety trained in accordance with 29 CFR-1910.120.

The four (4) replacement monitor wells (MW-2A, MW-7A, MW-8A, and MW-12A) were drilled using a truck mounted rotary drilling rig in accordance with New Mexico Administrative Code (NMAC) 19.27.4 and New Mexico Environmental Department (NMED) Groundwater Quality Bureau guidelines.

Each monitor well was constructed using four (4) inch, schedule 40 PVC casing from surface to TD including 30-ft of 0.010 slotted casing into the saturated section. A filter pack consisting of 8/16 graded silica sand was installed in the annulus between the casing and the formation from TD to above the top of well screen. The annulus was then filled from the top of the filter pack to approximately two (2) feet bgs with bentonite chips. After the bentonite seal was hydrated, the well annulus was topped with cement to the surface. A steel well vault was installed approximately three (3)-ft above ground to provide access to the monitor well for gauging and sample collection. State of New Mexico Well Reports are included in Appendix D with the boring logs. The locations of the four (4) replacement monitor wells are depicted on the site map located in Appendix A.

Monitor wells MW-7A and MW-8A were drilled on April 19 and 20, 2011 using air rotary drilling methods and an 8 ½-inch bit. Both wells were over drilled to 110-feet to ensure that casing could be set at the appropriate depth, which was specified at approximately 20-ft into the saturated section. Due to persistent formation slough in the saturated section, casing was set at 102.67-ft in monitor well MW-8A and 101.21-ft in monitor well MW-7A.

Monitor wells MW-2A and MW-12A were drilled on April 28, 2011 using mud rotary to a total depth of 110-ft bgs. Casing was set at 109.32-ft in monitor well MW-2A and 108.06-ft in monitor well MW-12A.

The well logs that portray the well construction details are found in Appendix D.

2.2 Soil Samples

Drill cuttings circulated to the surface were collected at appropriate intervals using a shovel and the samples were characterized in the field for physical properties in accordance with Unified Soil Classification System. The soil samples were also analyzed in the field for petroleum contaminants using a MiniRAE 2000 portable VOC monitor with a photo-ionization detector (PID) equipped with a 10.6 eV gas discharge lamp. The PID was calibrated prior to use with 100-ppm isobutylene. The results of the soil sample characterization are presented on the well boring logs in Appendix D.

Soil samples were collected for laboratory analyses from monitor wells MW-7A and MW-8A at 80-90-ft. The samples were placed in laboratory provided four (4) ounce soil jars, placed on ice in a cooler and transported to Trace Analysis laboratory in Midland Texas. The samples were analyzed for BTEX by EPA Method 8021 and TPH by EPA Method 418.1. Soil sample analytical results are summarized on Table 2 in Appendix B.

Soil samples were not collected for laboratory analysis from monitor wells MW-2A and MW-12A because those wells were drilled with gelled water and the samples were of poor quality.

By comparison, analytical results from the 80-90-ft sample collected from MW-7A and the analytical results from the 74-75-ft sample collected from MW-7 exhibited similar concentrations of TPH, toluene, ethylbenzene and xylenes (TEX). However benzene was not detected in the sample collected from MW-7A and benzene was detected in the sample collected from MW-7.

Analytical results from the 80-90-ft sample collected from MW-8A and the analytical results from the 74-75-ft sample collected from MW-8 exhibited dissimilar concentrations of BTEX, that is, the MW-8 sample did not exhibit TEX concentrations but did exhibit benzene, whereas, MW-8A did not exhibit benzene but did exhibit TEX concentrations. Also, TPH was detected in the MW-8A 80-90-ft sample, whereas, TPH was not detected in the MW-8 74-75-ft sample.

2.3 Drill Cuttings

Drill cuttings were transported from each monitor well location and stockpiled adjacent to the site system recovery tank compound. A composite sample of the drill cutting was collected and analyzed for BTEX by EPA Method 8021 and TPH by EPA Method 418.1. Analytical results indicate that the TPH concentration was 94.2 mg/Kg and the total BTEX concentration was 0.0217 mg/Kg. Analytical results are summarized on Table 2 in Appendix B.

2.4 Monitor Well Plugging

As previously noted, groundwater levels have consistently declined every year since groundwater measurements were initiated in 2002. Groundwater levels declined below the total depths of monitor wells MW-7 and MW-8; therefore, those monitor wells were plugged and abandoned. Plugging procedure was performed in accordance with NMAC 19.27.4 and NMED guidance. After an unsuccessful attempt to pull the casing from each well, 3/8-inch bentonite

chips were placed into the casing from TD to surface. The bentonite seal was hydrated with fresh water at ten (10) feet lifts. After plugging, the surface vault and concrete pad were removed. Copies of the State of New Mexico Well Plugging Records for MW-7 and MW-8 are located in Appendix D.

Monitor wells MW-2 and MW-12 were not plugged at this time because they still contain a minor amount of fluid and can be used for gauging purposes when monitor wells MW-2A and MW-12A contain pumps.

2.5 Groundwater Gauging and Development Procedures

Each newly installed monitor well was developed by removing five (5) casing volumes of fluid using a four (4) inch Grunfos stainless steel electric pump. The purge water and phase separated hydrocarbon (PSH), if recovered, were contained in 55-gallon drums and transferred to the on-site recovery tank. The fluid will then be transferred to the Rocky Smith SWD (NM #307219) for disposal.

After well development, each newly installed monitor well was measured with an oil/water interface probe. The gauging results collected were incorporated in Table 1, Appendix B – Summary of Historical Fluid Level Measurements.

Groundwater samples will be collected from the newly installed monitor wells that were not impacted with PSH during the next quarterly monitoring event in June of 2011.

3.0 RECOMMENDATIONS

3.1 Recommendations

Subsequent to new monitor well installation, Talon proposes the following actions:

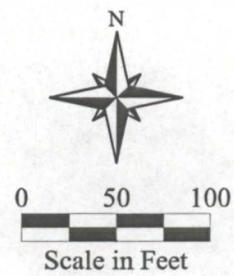

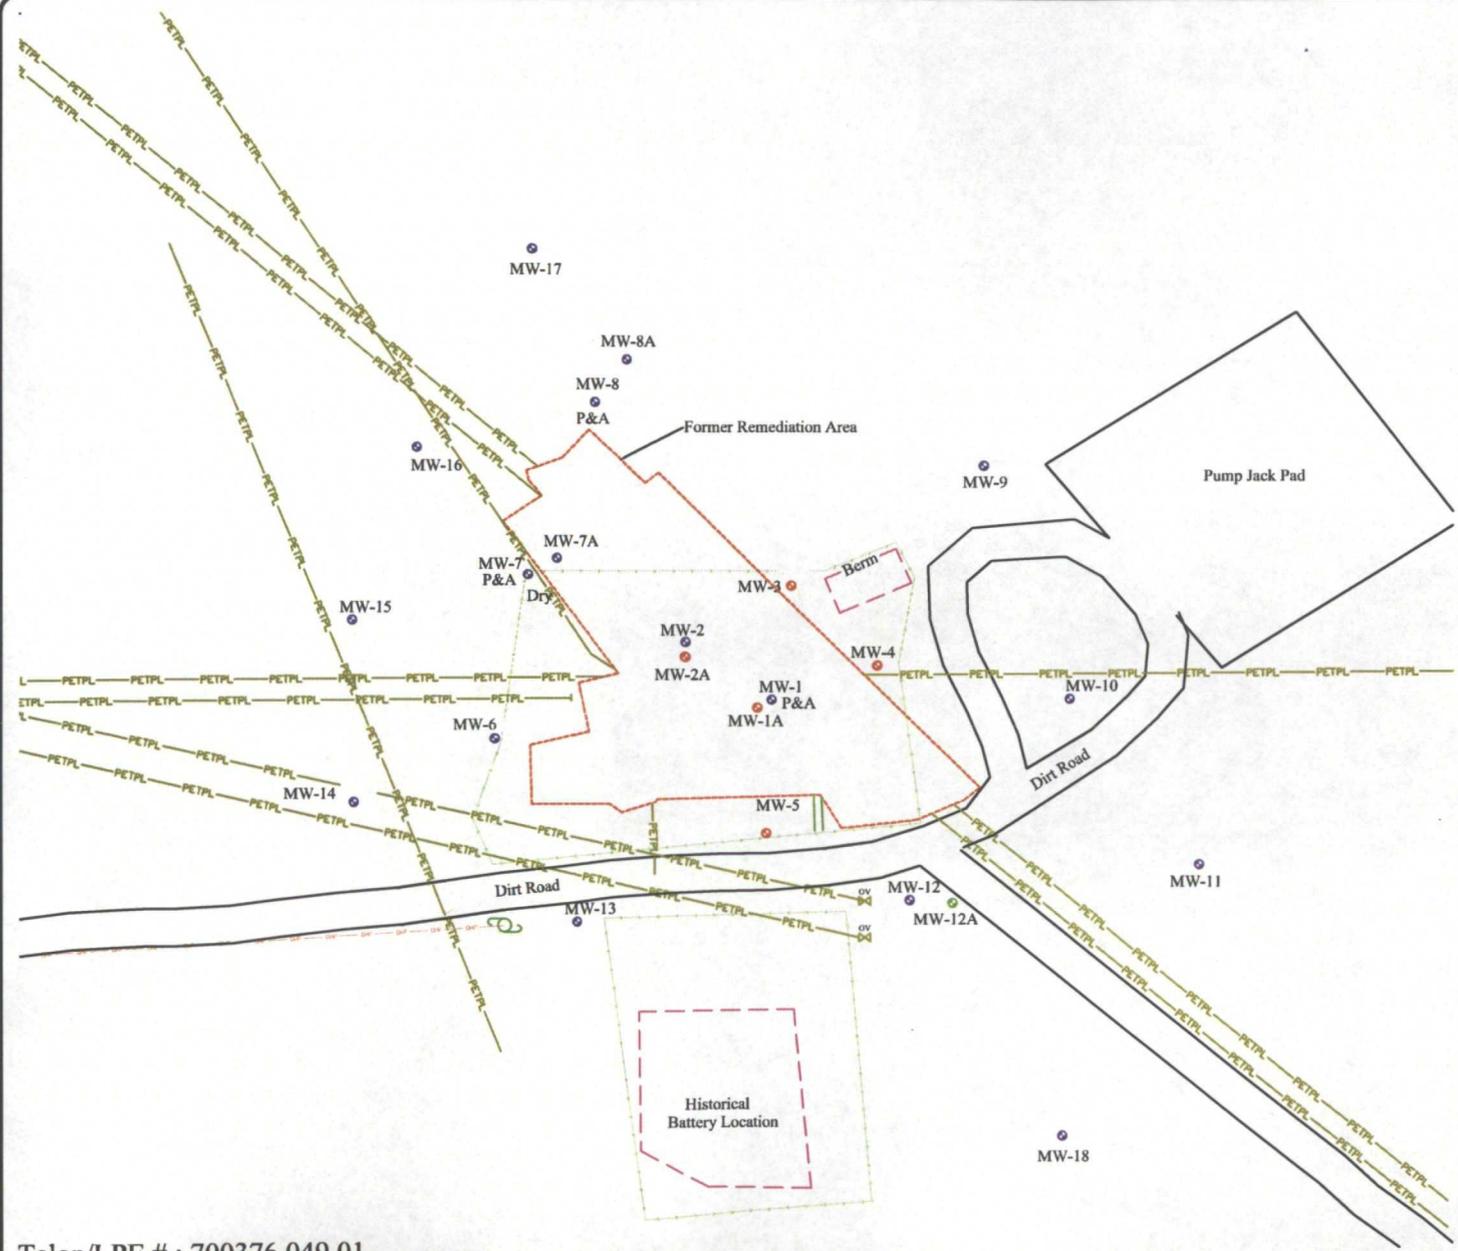

- Install pneumatic total fluids pumps in newly installed monitor well MW-2A, and MW-4 and install skimmers with bladder pumps in newly installed monitor wells MW-7A and MW-12A in order to optimize PSH recovery and inhibit plume migration.
- Continue to monitor PSH plume distribution and recovery volumes in order to adjust pump depths and cycles to the optimal configuration.

TALON/LPE PROJECT NUMBER 700376.049.01

Monitoring Well	Date Gauged	Surveyed Top of Casing Elevation (amsl)	Depth to PSH (btoc)	Depth to Water (btoc)	PSH Thickness (feet)	Corrected Groundwater Elevation (ft amsl)
-----------------	-------------	---	---------------------	-----------------------	----------------------	---

Corrected Groundwater Elevation = Top of Casing Elevation - (Depth to Water Below Top of Casing - (SG)(PSH Thickness)) SG=0.835

** Estimated Product Thickness using Total Depth of Well as the Depth to Water.

ND = Not Detected

NM = Not Measured

btoc = Below Top of Casing

amsl = Above Mean Sea Level

Analytical and Quality Control Report

Steve Killingsworth
 Talon LPE-Midland
 2901 State Highway 349
 Midland, TX, 79706

Report Date: April 6, 2011

Work Order: 11032906

Project Location: Cayler, NM
 Project Number: 700376.049.01
 SRS #: 2002-10250

Enclosed are the Analytical Report and Quality Control Report for the following sample(s) submitted to TraceAnalysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received
261993	MW-8A (80-90)	soil	2011-03-22	00:00	2011-03-25
261994	MW-7A (80-90)	soil	2011-03-23	00:00	2011-03-25

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

This report consists of a total of 9 pages and shall not be reproduced except in its entirety, without written approval of TraceAnalysis, Inc.

Michael Abel

Dr. Blair Leftwich, Director
Dr. Michael Abel, Project Manager

Standard Flags

B - The sample contains less than ten times the concentration found in the method blank.

Case Narrative

Samples for project were received by TraceAnalysis, Inc. on 2011-03-25 and assigned to work order 11032906. Samples for work order 11032906 were received intact at a temperature of 2.5 C.

Samples were analyzed for the following tests using their respective methods.

Test	Method	Prep Batch	Prep Date	QC Batch	Analysis Date
BTEX	S 8021B	67765	2011-03-29 at 14:17	79865	2011-03-29 at 14:17
TPH 418.1	E 418.1	67956	2011-04-05 at 15:00	80089	2011-04-05 at 20:17

Results for these samples are reported on a wet weight basis unless data package indicates otherwise.

A matrix spike (MS) and matrix spike duplicate (MSD) sample is chosen at random from each preparation batch. The MS and MSD will indicate if a site specific matrix problem is occurring, however, it may not pertain to the samples for work order 11032906 since the sample was chosen at random. Therefore, the validity of the analytical data reported has been determined by the laboratory control sample (LCS) and the method blank (MB). These quality control measures are performed with each preparation batch to ensure data integrity.

All other exceptions associated with this report have been footnoted on the appropriate analytical page to assist in general data comprehension. Please contact the laboratory directly if there are any questions regarding this project.

Param	MS Result	Units	Dil.	Spike Amount	Matrix Result	Rec.	Rec. Limit
TRPHC	⁵ 3760	mg/Kg	10	250	3350	164	43 - 161

Percent recovery is based on the spike result. RPD is based on the spike and spike duplicate result.

⁵Matrix spike recovery out of control limits due to peak interference. Use LCS/LCSD to demonstrate analysis is under control.

KEY TO SYMBOLS

Symbol Description

Strata symbols

 Well graded gravel

 Well graded sand

 Poorly graded sand

 Well graded gravel
and sand

 Silty sand

 Silty sand and gravel

Misc. Symbols

 Water table at
boring completion

Soil Samplers

 Bulk/Grab sample

Monitor Well Details

 Capped riser with locking
cover

 Concrete seal

 Bentonite pellets

 Silica sand, blank PVC

 Slotted pipe w/ sand

 No pipe, filler material
