## 1.0 EXECUTIVE SUMMARY

This report presents 2013 groundwater monitoring results for the Empire Abo Gas Plant (Facility) operated by Frontier Field Services, LLC (Frontier) which is a wholly owned subsidiary of AKA Energy Group (AKA). The Facility processes natural gas using cryogenic methods to remove simple alkanes (i.e. ethane, propane, pentane and hexane). The Facility is located approximately 9 miles east - southeast of Artesia, in Unit I (NE/4, SE/4), Section 3, Township 18 South, Range 27 East, Eddy County, New Mexico. The geodetic position is north 32° 46' 37.4" and west 104° 15' 32.7".

The following activities occurred during 2013:

- First semi-annual groundwater gauging and sampling event – May 20, 2013;
- Second semi-annual groundwater gauging and sampling event – October 15, 2013

The following is documented in the report:

- Groundwater mounding is present beneath the Facility and causes groundwater to flow in a radial pattern;
- The regional groundwater flow direction is to the east – southeast therefore well MW-06 is considered the background monitoring well;
- Wells EB-01 and P-04 were dry during the first (1<sup>st</sup>) and second (2<sup>nd</sup>) monitoring events;
- Hydrocarbon product (LNAPL) was observed in 19 monitoring wells during the reporting period with apparent LNAPL thicknesses ranging from about 0.02 feet (MW-14) to 5.12 feet (MW-06);
- Dissolved benzene exceeded the New Mexico Water Quality Control Commission (WQCC) human health standard of 0.10 milligrams per liter (mg/L) in 12 monitoring wells during the reporting period;
- Dissolved chromium was the only WQCC metal reported above the NMWQCC human health standard of 0.05 mg/L and was reported in three (3) wells (MW-02-03, EB-04 and MW-07) during the reporting period;
- The extent of the dissolved benzene in groundwater was delineated;
- Chloride, sulfate and TDS are highest near the northwest corner of the Facility and likely due to dissolution of minerals, predominantly gypsum, from the Tansill formation from a water leak in the cooling tower basin;
- Sulfate is naturally occurring and elevated due to dissolution of gypsum with concentrations exceeding the WQCC domestic water quality standard (600 mg/L) in all wells.

An evaluation of the abatement option, including permitting and installing an SWD or AGI well, is under consideration by AKA. Frontier will continue groundwater monitoring during 2014 and submit the results in an annual report. Frontier will notify the OCD at least 48 hours prior to the annual monitoring events, and as soon as possible upon any significant change in analyte concentrations.

## 2.0 INTRODUCTION

This report presents 2013 groundwater monitoring results for the Empire Abo Gas Plant (Facility) operated by Frontier Field Services, LLC (Frontier), a wholly owned subsidiary of AKA Energy Group (AKA). The Facility is located approximately 9 miles east-southeast of Artesia, in Eddy County, New Mexico. The legal description is Unit I (NE/4, SE/4), Section 3, Township 18 South, Range 27 East. The geodetic position is north 32° 46' 33.7" and west 104° 15' 37.22". Figure 1 presents the location on a topographic map. Figure 2 presents an aerial photograph. Figure 3 presents a Facility drawing.

### 2.1 Background

The Facility is a natural gas processing plant that utilizes cryogenic processes to remove simple alkanes (i.e. ethane, propane, pentane and hexane) from natural gas. The Facility previously operated under a New Mexico Water Quality Control Commission (WQCC) discharge permit (GW-022) administered by OCD. The discharge permit was not renewed by OCD following completion of a questionnaire ("Oil & Gas Facilities Questionnaire for Determination of a WQCC Discharge Permit") by Frontier stating that the Facility did not have intentional discharges other than potable water onto the ground or directly into surface or groundwater. The OCD issued case number AP-112 for remediation of groundwater contamination and requested Frontier to submit an abatement plan for groundwater contamination. An abatement plan was submitted to the OCD on January 15, 2013. Implementation of the groundwater abatement plan was contingent on approval from the Office of the State Engineer (OSE) to extract groundwater and permitting, installation and start-up of a disposal (SWD or AGI) well. On March 8, 2013, the OSE approved Frontier's request to extract the groundwater. Consideration for an SWD or AGI well is currently review and consideration by Frontier management.

Previous investigations at the Facility have identified light non-aqueous phase liquid (LNAPL) on groundwater and dissolved benzene in groundwater resulting from release of natural gas condensate from subsurface piping. The LNAPL and dissolved benzene are present in 4 areas including the northeast, west-central, east-central and southwest areas of the Facility. The groundwater contains naturally elevated concentrations of sulfate and total dissolved solids (TDS) that exceed the WQCC domestic water quality standards of 600 and 1,000 milligrams per liter (mg/L), respectively.

### 2.2 Topography and Surface Water

The surface elevation is approximately 3,550 feet above mean sea level (MSL) and slopes to the southeast. The Facility is located approximately 3.4 miles east-northeast of the Pecos River. The nearest drainage is an unnamed wash located west of the Facility. The unnamed wash flows south to Scoggins Draw (aka Coggins Draw on some early maps) about 1,300 feet south of the Facility. Scoggins Draw flows southwest to ephemeral Chalk Bluff Draw located about 3 miles downstream. Chalk Bluff Draw flows to the Pecos River located about 1.8 miles further downstream.

When comparing the elevation of Scoggins Draw and the depth to groundwater from the nearest monitoring wells (P-04, EB-07, and EB-01), depth to groundwater is estimated to be about 25 or more feet below the drainage. This watercourse is a losing stream without groundwater affecting surface water or discharging to the surface. There are no documented springs, seeps or marshes within 1-mile of the outside perimeter of the Facility. Figure 1 presents a topographic map.

## **2.3 Geology**

The dominant regional feature is the Pecos Slope, a broad geologic structure with a low eastward dip of about 50 to 100 feet per mile. The western extents of the Pecos Slope are the Mescalero Arch, and Sacramento and Guadalupe uplift structural divides (Kelley, 1971). The eastern extents of the Pecos

Slope are the Delaware and Midland Basins. This Pecos Slope is a monocline that is imprinted with other structural features, including the southern flank of the Artesia-Vacuum Arch, which reflects the underlying Abo reef trend.

The Artesia-Vacuum Arch extends from beneath the Pecos Valley fill to the west, extending through Townships 17 through 19 south, eastward to Range 35 East in Lea County (Kelley, 1971). The arch is covered by post-Permian strata, except in a four to five mile stretch near Chalk Bluff Draw. In the vicinity of the Facility, the plunging south limb of Yates and Tansill Formations dip about 4° South 47° east. Brittle deformation of the Artesia Group members caused fractures that are subject to dissolution by groundwater interaction.

The lowest encountered formation at the Facility is the Permian-age Yates formation of the Artesia Group. The Yates formation is named for the Yates oilfield in Pecos County, Texas, and has wide aerial extent in both surface exposures and subsurface wells samples. The Yates formation is approximately 250 to 350 feet thick and is documented as siltstone north of Roswell, New Mexico, carbonate and evaporites west and northwest of Carlsbad, and as gypsum north of Lake McMillan to near Roswell (the vicinity of the Facility). At the Facility it appears as red mudstone/shale/clay reported at the base of monitor well borings is the top of the Yates formation.

Above the Yates formation is the Tansill formation of the Artesia Group. The type section of the Tansill formation is found along US Highway 285 about 2 miles north of Carlsbad and is reported to be predominantly dolomite. The reef shelf margin is about 300 – 325 feet thick (Kelley, 1971), however, this facies gives way to evaporite facies about 10 miles north of the type section. In the vicinity of the Facility the Tansill Formation is part of a irregularly shaped north-trending belt that is generally less than a mile wide and comprised of anhydrite and salt about 100 feet thick. At the Facility the anhydrite, gypsum and salts of the Tansill formation appear to be the bulk of the strata encountered in monitor wells and borings, and is the aquifer of concern.

## **2.4 Groundwater Occurrence**

Groundwater occurs in the Tansill formation. The base of the water-bearing strata is interpreted as the red shale between approximately 3,460 and 3,480 feet above mean sea level (MSL).

The historic groundwater flow direction is towards the south-southwest consistent with the surface drainage (Hendrickson and Jones, 1952). During investigations, LAI observed groundwater mounding under the north-central and east-central areas of the Facility which has affected the groundwater flow direction. Current groundwater potentiometric maps depict groundwater movement south of the mound moving towards the east and southeast, while groundwater to the north of the mounds appears to be moving towards the north and northeast. The mounding may be due in part to a combination of process water and pipeline leaks and perched water in shallow discontinuous clay and silty-clay units.

2013 Annual Groundwater Monitoring Report  
 Frontier Field Services LLC  
 Empire Abo Gas Plant  
 Eddy County, New Mexico  
 July 9, 2014

Depth to groundwater was measured in fifty-four (54) monitoring wells on May 20, 2013 and October 14 and 15, 2013. The measurements were collected at the top of the PVC well casing with an electronic oil and water interface probe that was decontaminated between wells with a solution of Alconox® detergent and water and rinsed with distilled water.

Groundwater elevations in the more peripheral monitor wells remained relatively stable with seasonal fluctuation of a few feet between May and October 2013. On May 20, 2013, groundwater was encountered between approximately 7.56 (MW-07) and 109.44 (MW-16) feet bgs. Shallow groundwater was observed within the facility operation area where water lines leaks were discovered and repaired, while the deepest groundwater was encountered in well MW-16 located north of the Facility. Similar results were observed on May 20, 2013. Table 1 presents a summary of monitoring well gauging data. Figure 4a and Figure 4b present groundwater potentiometric maps for May 20, 2013 and October 14 and 15, 2013, respectfully.

The following monitoring wells were dry during 2013:

Well	May 20, 2013	October 14-15, 2013
P-04	✓	✓
EB-01	✓	✓

## 2.5 Light Non-Aqueous Phase Liquid

Light non-aqueous phase liquid (LNAPL) in the form of natural gas condensate was measured in 17 monitoring wells during the May and October 2013 monitoring events. The LNAPL was observed in wells located near the west central (MW-02-09, MW-02-13, MW-02-14, MW-03-01, MW-09, MW-10 and MW-06), southwest (MW-03-02 and MW-19), east central (MW-02-06, MW-02-10, MW-02-11, MW-04, MW-20 and MW-21) and northwest (MW-03-04) areas of the Facility. LNAPL was also observed east (EB-08) and southeast (EB-03 and MW-14) of the Facility.

On May 20, 2013, the apparent LNAPL thickness ranged from approximately 0.02 (MW-14) to greater than 10 feet (MW-02-10). On October 14 and 15, 2013, the apparent LNAPL thickness ranged from approximately 0.05 (MW-11) to greater than 10 feet (MW-02-10).

The following monitoring wells reported LNAPL during 2013:

Well	May 20, 2013	October 14-15, 2013
MW-02-06	✓	✓
MW-02-09	✓	✓
MW-02-10	✓	✓
MW-02-11	✓	✓
MW-02-13	✓	✓
MW-02-14	✓	✓
MW-03-01		✓
MW-03-02	✓	✓
MW-03-04	✓	✓
MW-04	✓	✓
MW-06	✓	✓
MW-09		✓
MW-10	✓	✓

MW-14	✓	
MW-19	✓	✓
MW-20	✓	✓
MW-21	✓	✓
EB-03	✓	
EB-08	✓	✓

Table 1 presents a summary of apparent LNAPL thickness measurements. Figure 5a and 5b present apparent LNAPL thickness maps for May 20, 2013 and October 14 and 15, 2013, respectively.

Referring to Figures 5a and 5b, the area of greatest LNAPL thickness occurs near the west central area of the Facility, in the vicinity of wells MW-02-09, MW-02-13, MW-02-14, MW-03-01, MW-09, MW-10 and MW-06, where the gas inlet is located. Discussions with former employees indicated that leaks were observed in piping that was replaced.

Figure 5c and 5d present control charts for apparent LNAPL thickness over time and suggests that LNAPL thickness near the west central area of the Facility is decreasing (MW-02-09, MW-02-13, MW-10 and MW-19). The data also suggest that LNAPL thickness is increasing in vicinity of MW-06 and MW-03-02 located near the west central and southwest areas of the Facility, respectively.

### 3.0 GROUNDWATER SAMPLES AND LABORATORY ANALYSIS

Groundwater samples were collected from 33 monitoring wells during the first semi-annual events on May 20-23, 2013, and from 29 wells during the second semi-annual event on October 15-17, 2013. Seventeen (17) wells were not sampled in May and October 2013, due to the presence of LNAPL. Wells EB-01 and P-04 were dry during the sampling events in May and October, 2013.

The groundwater samples were collected after removing approximately three (3) well volumes of groundwater or purging dry with dedicated disposable polyethylene bailers or pumping with an electric submersible pump and dedicated tubing. The samples were carefully transferred to laboratory containers that were labeled, sealed with custody labels, packed in an ice filled chest and delivered under chain of custody control to DHL Analytical, Inc. (DHL), a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory, located in Round Rock, Texas. All samples for metals analysis were filtered by the laboratory to exclude particles larger than  $0.45\mu$  and acidified with nitric acid within 24-hours of collection. DHL analyzed the samples for benzene, toluene, ethylbenzene, xylene (BTEX) by method SW-8021B, dissolved metals (arsenic, barium, cadmium, calcium, chromium, lead, magnesium, potassium, selenium, silver, sodium) by methods SW-6020 and 7470A (October 2013), anions, alkalinity and total dissolved solids (TDS) by methods E-300, M2320B and M2540, respectively. Duplicate samples were collected from wells EB-5 (May 20, 2013), P-03 (May 21, 2013), MW-09 (May 22, 2013) and MW-02-12 (May 23, 2013) for quality assurance and quality control (QA/QC) purposes. Purge water was contained in a portable tank and discharged to the Facility's process water system for disposal in an offsite OCD permitted Class II injection well. Table 2 presents the BTEX analytical data summary. Table 2a presents the BTEX analytical quality control data summary. Table 3 presents the dissolved metals analytical data summary. Table 3a presents the dissolved metals analytical quality control data summary. Table 4 presents the general chemistry, including anion, cation and TDS, analytical data summary. Table 4a presents the general chemistry analytical quality control data summary. The laboratory analytical reports are presented on a CD ROM in Appendix A.

### **3.1 BTEX Analysis**

All benzene values represent dissolved-phase concentrations that are well below the solubility limit of 1,770 mg/L. During May 2013, dissolved benzene exceeded the WQCC human health standard of 0.01 mg/L in samples fourteen (14) wells (MW- 2-07, MW 2-15, MW 2-16, MW 2-18, MW-03, MW 3-01, MW 3-03, MW-07, MW-09, MW-12, MW-13, MW-17, MW-22, and EB-03). During October 2013, dissolved benzene exceeded the WQCC human health standard in ten (10) wells (MW 2-15, MW 2-16, MW 2-18, MW-03, MW 3-03, MW-07, MW-12, MW-22, and P-02). During May and October 2013, benzene was less than the method detection limit (<0.0008 mg/L) in down gradient wells EB-07 and EB-04 confirming the benzene plume was delineated down gradient.

Toluene in well MW-07 exceeded the WQCC human health standard (0.75 mg/L) during the May and October 2013 sampling events. Toluene, ethylbenzene and xylenes were below the WQCC human health standards in the remaining wells that were sampled.

#### **May 2013 Benzene Results**

The following samples exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- |                        |                      |
|------------------------|----------------------|
| • MW- 2-07 (3.19 mg/L) | MW-2-15 (0.973 mg/L) |
| • MW 2-16 (0.138 mg/L) | MW-2-18 (19.2 mg/L)  |
| • MW-03 (1.3 mg/L)     | MW-3-01 (32 mg/L)    |
| • MW 3-03 (2.36 mg/L)  | MW-07 (14.4 mg/L)    |
| • MW-09 (4.4 mg/L)     | MW-12 (0.0495 mg/L)  |
| • MW-13 (2.71 mg/L)    | MW-17 (0.0427 mg/L)  |
| • MW-22 (10.2 mg/L)    |                      |

A comparison of the primary (<0.000800 mg/L) and duplicate (<0.000800 mg/L) samples from EB-05 indicates no deviation. The case narrative indicates some samples were diluted prior to analysis due to the nature of the samples (concentration of target compounds). Figure 6a presents a map of dissolved benzene concentrations from the May 2013 sampling event.

#### **October 2013 Benzene Results**

The following samples exhibited benzene concentrations above the WQCC human health standard of 0.01 mg/L:

- |                        |                      |
|------------------------|----------------------|
| • MW-02-07 (5.09 mg/L) | MW 2-15 (0.376 mg/L) |
| • MW-2-16 (0.384 mg/L) | MW 2-18 (15.5 mg/L)  |
| • MW-03 (2.42 mg/L)    | MW 3-03 (1.52 mg/L)  |
| • MW-07 (14.6 mg/L)    | MW-12 (1.48 mg/L)    |
| • MW-14 (0.0941 mg/L)  | MW-22 (5.48 mg/L)    |
| • P-02 (0.122 mg/L)    | EB-03 (0.0982 mg/L)  |

No data quality exceptions were noted in the DHL case narratives. Figure 6b presents a concentration map of dissolved benzene concentrations reported in groundwater samples from the October 2013 sampling event.

### **3.2 Dissolved Metals Analysis**

Samples for dissolved metals were collected during the October 2013 event and reported dissolved chromium above the WQCC human health standard of 0.05 mg/L in wells MW-07 (0.577 mg/L), MW-02-03 (0.0545 mg/L) and EB-04 (0.13 mg/L). These results are consistent with previous sampling events. The remaining dissolved metal compounds (arsenic, barium, cadmium, lead, mercury,, selenium and silver were not reported at concentrations exceeding the WQCC human health standards.

Chromium concentrations indicate no clear increasing or decreasing trends. The spatial distribution of chromium above the WQCC human health standard of 0.5 mg/L does not indicate a possible source. The highest chromium was reported in well EB-04 which is located hydraulically cross-gradient from the Facility. Figure 7 presents a map showing dissolved chromium in groundwater exceeding the WQCC human health standard.

**(Metals are sampled once annually and were sampled in October 2013)**

### **3.3 General Chemistry Analysis**

Sulfate and TDS are naturally elevated above the WQCC domestic water quality standards of 600 and 1,000 mg/L due to interaction groundwater in the Tansill formation and dissolution of gypsum. Chloride is variable in concentration but exceeded the WQCC domestic water quality standard of 250 mg/L in wells MW 02-02, MW 2-05, MW 2-15, MW-08, MW-09, MW-15, MW-16, MW-18, MW-23, EB-04, and P-04. Chloride, sulfate, and TDS concentrations over time have very similar trends and appear linear with neither increasing nor decreasing trends exhibited. A leak in the cooling tower basin and dissolution of mineral in the Tansill formation is suspected as the source for elevated chloride, sulfate and TDS near the northwest corner of the Facility. Dispersion of the chloride and TDS to the north and northeast is due principally to groundwater mounding near the center of the Facility which causes groundwater to flow north.

#### **May 2013 Results**

**Chloride** – The following samples exhibited chloride concentrations above the WQCC domestic water quality standard of 250 mg/L:

- |                          |                      |
|--------------------------|----------------------|
| • MW- 2-02 (10,800 mg/L) | MW-2-05 (5,840 mg/L) |
| • MW 2-15 (835 mg/L)     | MW-08 (278 mg/L)     |
| • MW-09 (318 mg/L)       | MW-15 (6,360 mg/L)   |
| • MW-16 (353 mg/L)       | MW-18 (734 mg/L)     |
| • MW-23 (326 mg/L)       | EB-04 (481 mg/L)     |

Data quality exceptions were noted in the DHL case narratives for chloride. Figure 8a presents a chloride concentration map of reported chloride concentrations in groundwater during the May 2013 sampling event.

**Sulfate** – all sulfate concentrations exceeded the WQCC domestic water quality standard of 600 mg/L and ranged from 1,270 mg/L (MW-09) to 355,000 mg/L (MW-2-05). The sulfate is the result of dissolution of minerals, principally gypsum, in the Tansill formation. The sulfate concentration at MW-2-02 (344,000 mg/L) and MW-2-05 (355,000 mg/L) is likely the result of a leak from the cooling tower basin and dissolution of minerals in the Tansill formation.

**TDS** – all TDS concentrations exceeded the WQCC domestic water quality standard of 1,000 mg/L and ranged from 2,640 mg/L (MW-3-03) to 533,000 mg/L (MW-2-05). The TDS is the result of dissolution of minerals, principally gypsum, in the Tansill formation. The TDS concentration at MW-2-02 (507,000 mg/L) and MW-2-05 (533,000 mg/L) is likely the result of a leak from the cooling tower basin and dissolution of minerals in the Tansill formation.

No data quality exceptions were noted in the DHL case narratives. Figure 9a presents a concentration map of TDS in groundwater during the May 2013 sampling event.

### October 2013 Results

**Chloride** – The following samples exhibited chloride concentrations above the WQCC domestic water quality standard of 250 mg/L during the October 2013 event:

- |                          |                       |
|--------------------------|-----------------------|
| • MW- 2-02 (16,400 mg/L) | MW-2-05 (10,400 mg/L) |
| • MW 2-15 (738 mg/L)     | MW-15 (1,320 mg/L)    |
| • MW-16 (381 mg/L)       | MW-18 (606 mg/L)      |
| • MW-23 (333 mg/L)       | EB-04 (387 mg/L)      |

Data quality exceptions were noted in the DHL case narratives. The matrix spike and matrix spike recoveries were out of control limits. This is flagged accordingly in the QC summary report. . Figure 8b presents a concentration map for observed chloride concentrations during the October 2013 sampling event.

**Sulfates** – all sulfate concentrations exceeded the WQCC domestic water quality standard of 600 mg/L and ranged from 1,020 mg/L (MW-3-13) to 237,000 mg/L (MW-2-05). The sulfate is the result of dissolution of minerals, principally gypsum, in the Tansill formation. The sulfate concentration at MW-2-02 (233,000 mg/L) and MW-2-05 (237,000 mg/L) is likely the result of a leak from the cooling tower basin and dissolution of minerals in the Tansill formation.

**TDS** – all TDS concentrations exceeded the WQCC domestic water quality standard of 1,000 mg/L and ranged from 2,460 mg/L (MW-8) to 458,000 mg/L (MW-2-05). The TDS is the result of dissolution of minerals, principally gypsum, in the Tansill formation. The TDS concentration at MW-2-02 (440,000 mg/L) and MW-2-05 (458,000 mg/L) is likely the result of a leak from the cooling tower basin and dissolution of minerals in the Tansill formation.

Data quality exceptions were noted in the DHL case narratives. The RPD of the sample duplicate was slightly above the method control limit. This is flagged accordingly in the QC Summary report. The associated LCS was within method control limits. No further corrective action was taken. Figure 9b presents a map showing TDS concentrations for the October 2013 sampling event.

## 4.0 CONCLUSIONS

The following conclusions are based on field observations and laboratory analysis of groundwater samples during the reporting period.

1. Groundwater is mounded beneath the Facility which causes a radial flow pattern. Mounding is occurs near the center of the Facility, in the vicinity of well MW-07, and causes a radial groundwater flow pattern. The regional groundwater flow direction is to the east and southeast, therefore, monitoring well EB-6, is considered up gradient to the Facility;
2. LNAPL was observed in 19 wells during the reporting period with apparent thicknesses ranging from about 0.02 feet (MW-14) to 5.12 feet (MW-06). LNAPL is most prevalent near the west central area of the Facility where employees have stated that under previous ownership leaks were observed in the inlet gas pipelines which were replaced. No overall increasing or decreasing trends in LNAPL thickness were observed during the reporting period except in wells MW-03-02, MW-06 and EB-08. Wells MW-03-02 and MW-06 are located near the southwest quadrant of the Facility and the LNAPL thickness increase may be attributed to groundwater migration since the wells are located southeast (hydraulically down gradient) of the area where LNAPL is most prevalent. Well EB-08 is located east of the Facility. LNAPL was not observed in this well until March 15, 2011 when it was measured at 0.02 feet. Presently the LNAPL thickness is about 2.30 feet. The LNAPL appears to be migrating with groundwater since prior to March 15, 2011, groundwater samples reported dissolved benzene concentrations between 2.58 to 5.77 mg/L. The dissolved benzene concentrations are well below the solubility limit of 1,770 mg/L. The LNAPL thickness in the remaining wells appears to fluctuate with seasonal groundwater fluctuation;
3. Dissolved benzene was observed in groundwater samples at concentrations above the WQCC human health standard (0.01 mg/L) from about 12 monitoring wells during the reporting period. The benzene concentrations ranged from 0.0234 mg/L (MW-23) to 19.2 mg/L (MW-02-18). The dissolved benzene concentrations do not show overall increasing or decreasing trends;
4. Chromium was the only WQCC human health metal reported at in groundwater samples at concentrations above the standard (0.05 mg/L). Chromium was reported at the following concentrations: 0.0545 mg/L (MW-02-03), 0.0577 mg/L (EB-04) and 0.13 mg/L (MW-07). The highest chromium concentration was observed in well MW-07 where groundwater mounding is most prevalent. Well EB-4 is located southwest and hydraulically cross gradient from the Facility. Chromium is not present above the method detection limit (MDL) or WQCC human health standard down gradient of the Facility. There is no apparent increasing or decreasing trend in dissolved chromium concentration;
5. Chloride, sulfate and TDS were elevated in groundwater in the vicinity of the cooling tower near the north side of the Facility. The elevated chloride, sulfate and TDS are attributed to concentration of these constituents resulting from a leak in the concrete basin of the cooling tower. The elevated chloride, sulfate and TDS migrate to the north due to groundwater mounding and are decreasing in concentration as observed in well MW-15. Sulfate is naturally occurring and elevated due to dissolution of gypsum with concentrations exceeding the WQCC domestic water quality standard (600 mg/L) in all wells.

## 5.0 RECOMMENDATIONS

On January 15, 2013, a report titled, "*Groundwater Abatement Plan, Empire Abo Gas Plant, Eddy County, New Mexico*" was submitted to the OCD. The plan proposed using nine (9) recovery wells for LNAPL recovery and plume control. The plan was contingent on the Office of the New Mexico State Engineer (NMOSE) granting approval for recovering the groundwater and permit for constructing and operating a salt water disposal (SWD) or acid gas injection (AGI) well for managing effluent from the groundwater remediation. On March 8, 2013, the OSE approved the request for recovering groundwater without the need for an appropriation. An evaluation of the abatement option, including permitting and installing an SWD or AGI well, is under consideration by AKA. Appendix B presents the NMOSE letter approving groundwater extraction.

Notes: Wells drilled Eades Drilling, Atkins Engineering and Scarborough Drilling. Wells completed with Schedule 40 threaded PVC.

All values are in feet, unless otherwise noted.

Survey datum based upon NAD 1927/NAVD 1929

bgs - below ground surface

TOC - top of casing

Wells drilled and installed by Alan Eades and Atkins Engineering. Schedule 40 threaded PVC casing and screen set.

\* Groundwater corrected for LNAPL thickness assuming 0.70 specific gravity.

\*\* Emulsion observed in well

>Groundwater not observed over entire screen interval

**Notes**

Volatiles analyzed via EPA SW846 Method 8021B by DHL Analytical, Inc.

All values reported in Milligrams per liter (mg/L, parts per million).

Blue and bold indicates the compound exceeded NMWQCC standards.

< values - Indicate the value is less than Method Detection Limit MDL.

Dissolved Metals	Collection Date	Arsenic	Barium	Cadmium	Calcium	Chromium	Lead	Magnesium	Mercury	Potassium	Selenium	Silver	Sodium
NMWQCC Standard (mg/L)		0.1	1	0.01	--	0.05	0.05	--	0.002	--	0.05	0.05	--

**Notes**

Metals analyzed via EPA SW846 Method 6020 by DHL Analytical Inc., Round Rock, Texas

Mercury analyzed via EPA SW846 Method 7470A by DHL Anaytical Inc., Round Rock, Texas

All values reported in Milligrams per liter (mg/L, parts per million).

< values - Indicate the value is less than Method Detection Limit MDL.

Blue and bold indicates analyte concentration above NMWQCC standard

**Notes**

Metals analyzed via EPA SW846 Method 6020 by DHL Analytical Inc., Round Rock, Texas

Mercury analyzed via EPA SW846 Method 7470A by DHL Anaytical Inc., Round Rock, Texas

All values reported in Milligrams per liter (mg/L, parts per million).

< values - Indicate the value is less than Method Detection Limit MDL.

**Notes**

Alkalinity analyzed via EPA Method 310.1 by DHL Anaytical Inc., Round Rock, Texas

Anions analyzed via EPA Method 300 by DHL Analytical Inc., Round Rock, Texas

TDS analyzed via EPA Method 160.1 by DHL Anaytical Inc., Round Rock, Texas

All values reported in Milligrams per liter (mg/L, parts per million).

< values - Indicate the value is less than Method Detection Limit MDL.

**N/S** Not Sampled - Insufficient Water For Sample

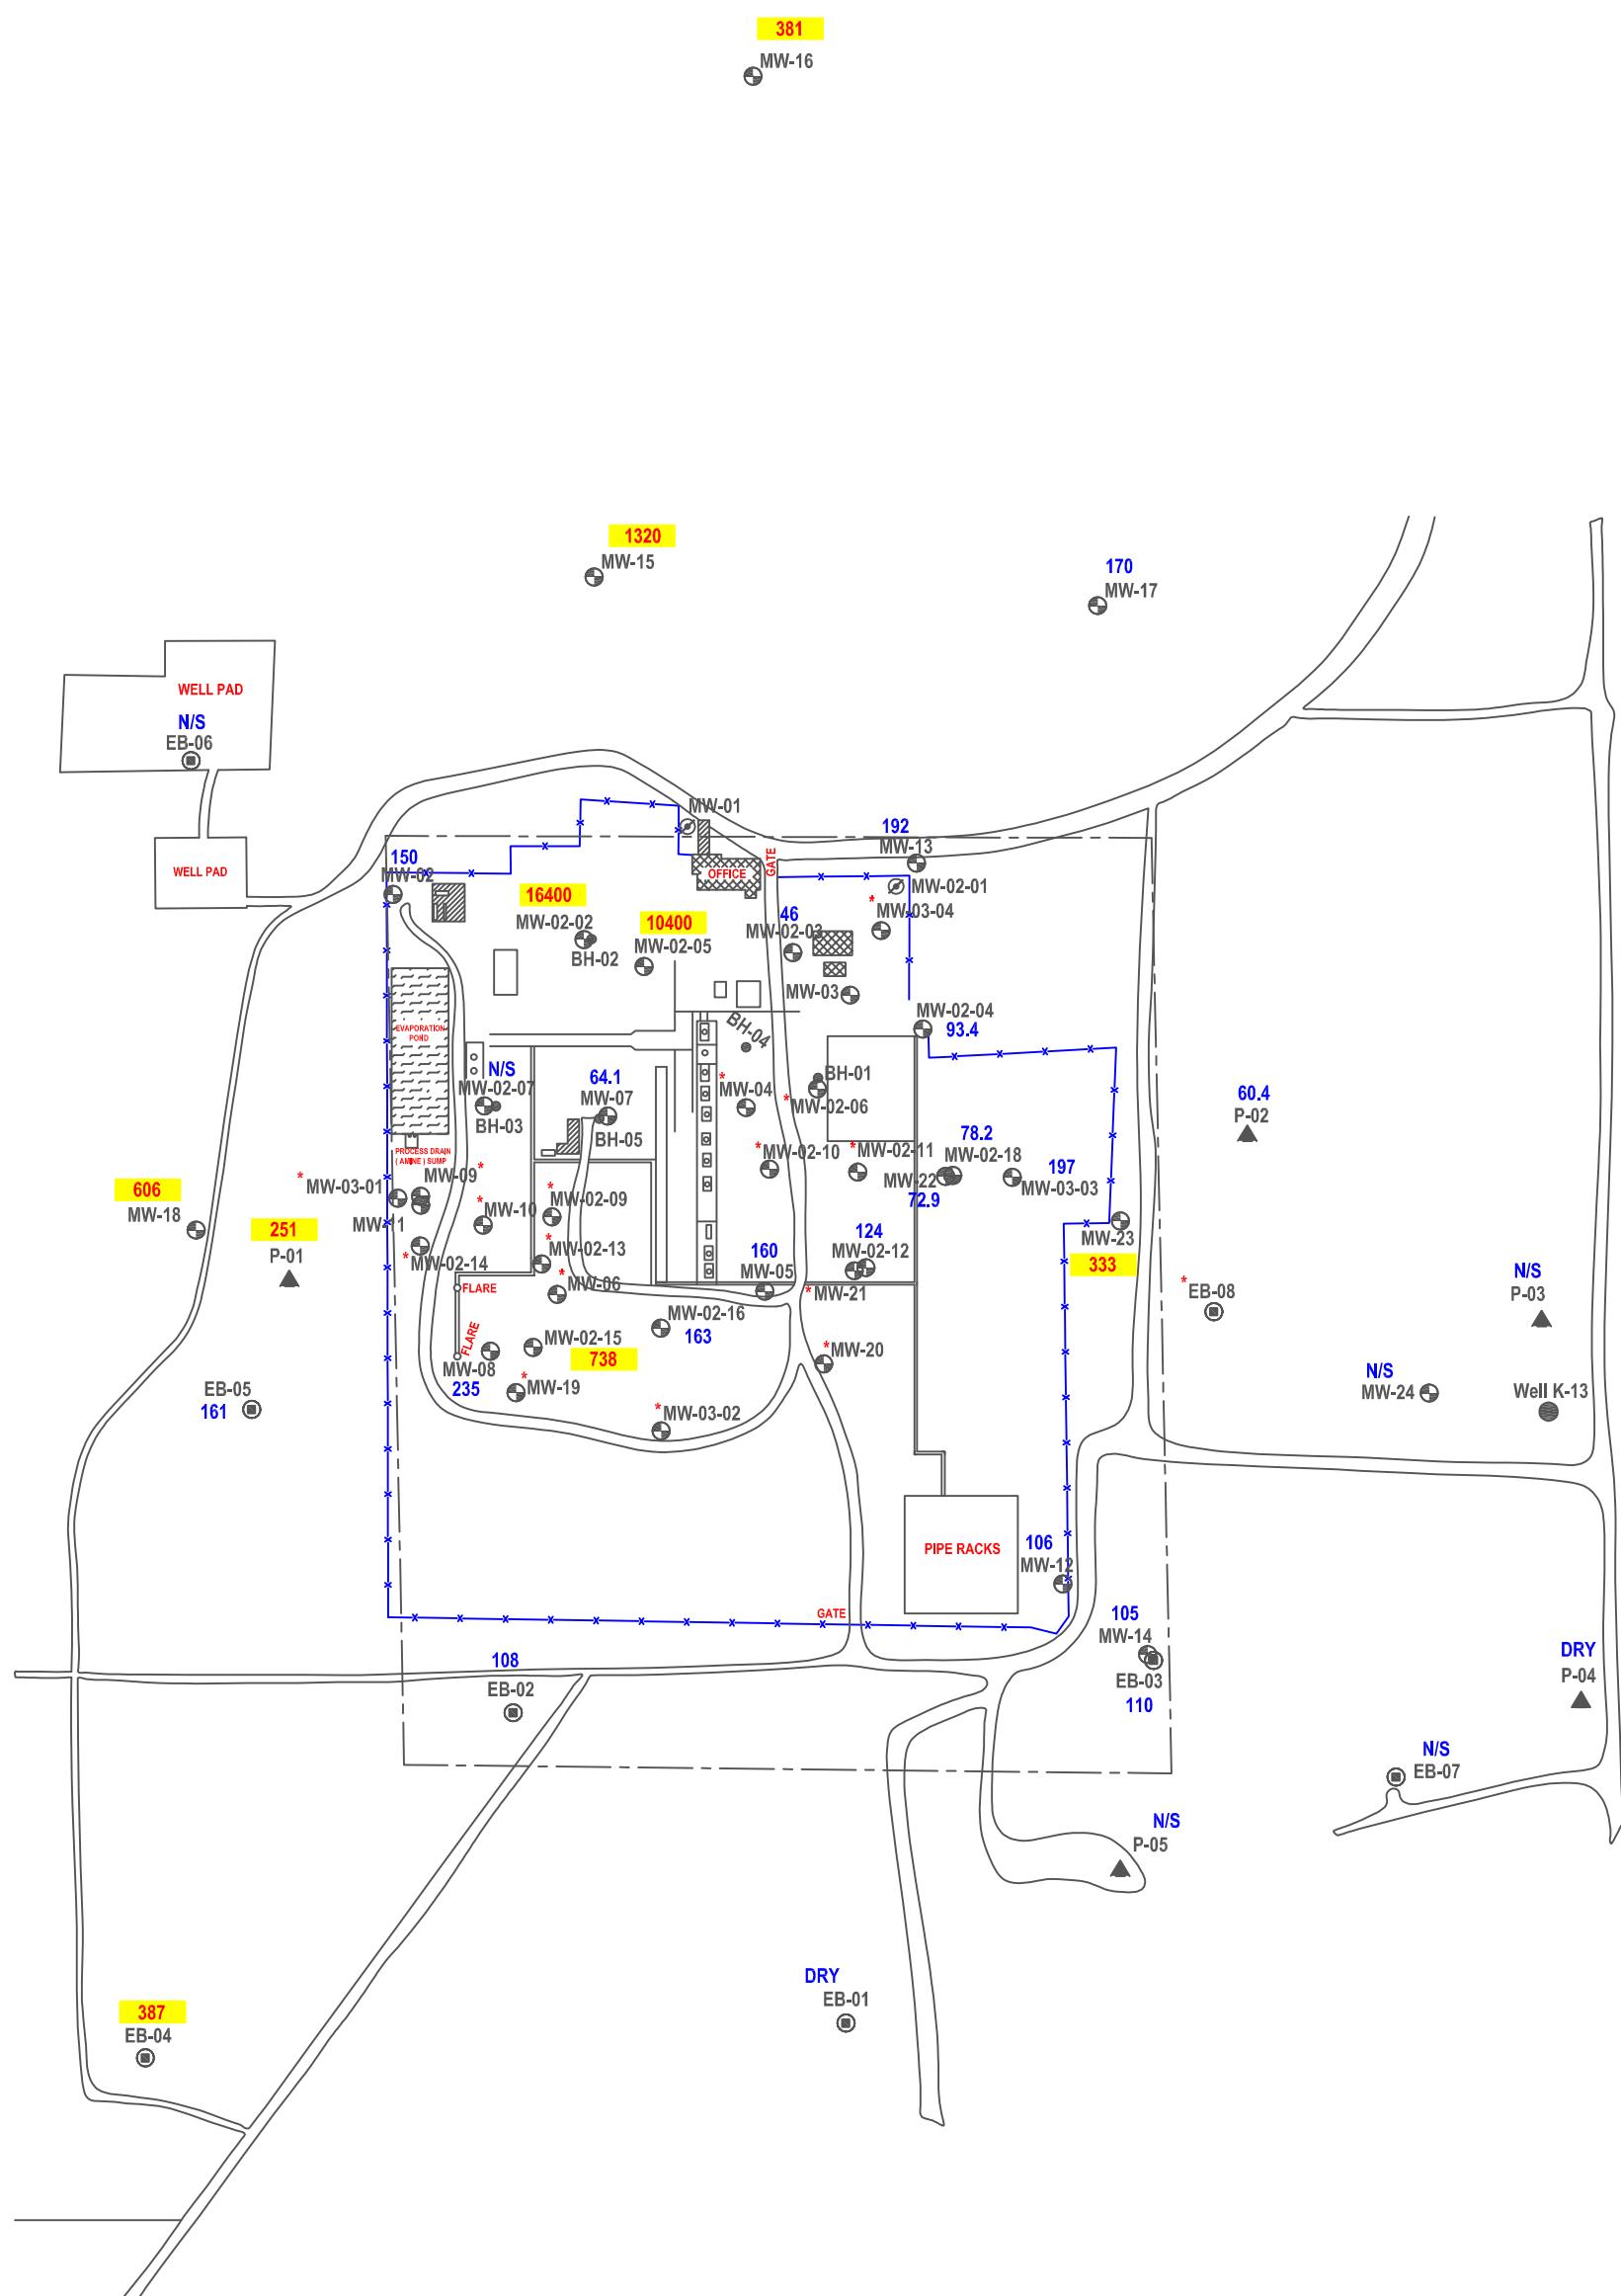

The diagram illustrates the reaction scheme for the synthesis of ethane (Et) from ethyl iodide (EtI). It shows the conversion of EtI to Et using two equivalents of sodium lithium alloy (SodLi) as a reducing agent. The reaction is represented by the equation:  $\text{EtI} + \text{2 SodLi} \rightarrow \text{Et} + \text{LiI}$ .

RE: Frontier ABO

Dear Coty Woolf:

DHL Analytical, Inc. received 18 sample(s) on 5/22/2013 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in red ink that reads "John DuPont".

John DuPont  
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-13-10

**CLIENT:** Larson & Associates  
**Project:** Frontier ABO  
**Lab Order:** 1305221

**CASE NARRATIVE**

Sample was analyzed using the methods outlined in the following references:

Method SW8021B - Volatile Organics by GC Analysis

Method E300 - Anions Analysis

Method M2540C - TDS Analysis

**LOG IN**

The samples were received and log-in performed on 5/22/13. A total of 18 samples were received. The Time of Collection was Mountain Standard Time. The samples arrived in good condition and were properly packaged.

**ANIONS ANALYSIS**

For Anions analysis performed on 5/22/13 the matrix spike recovery (1305221-12) was slightly below control limits for Chloride. This is flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for this analyte. No further corrective actions were taken.

RE: Frontier ABO

Dear Coty Woolf:

DHL Analytical, Inc. received 11 sample(s) on 5/23/2013 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in red ink that reads "John DuPont".

John DuPont  
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-13-10

**CLIENT:** Larson & Associates  
**Project:** Frontier ABO  
**Lab Order:** 1305234

**CASE NARRATIVE**

Sample was analyzed using the methods outlined in the following references:

Method SW8021B - Volatile Organics by GC Analysis

Method E300 - Anions Analysis

Method M2540C - TDS Analysis

**LOG IN**

The samples were received and log-in performed on 5/23/13. A total of 11 samples were received. The Time of Collection was Mountain Standard Time. The samples arrived in good condition and were properly packaged.

**ANIONS ANALYSIS**

For Anions analysis performed on 5/24/13 the matrix spike and matrix spike duplicate recoveries were out of control limits for Chloride and/or Sulfate. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were taken.

**VOLATILE ORGANICS BY GC ANALYSIS**

For Volatile Organics by GC analysis some samples were diluted prior to analysis due to the nature of the samples (concentration of target compounds).

RE: Frontier ABO

Dear Coty Woolf:

DHL Analytical, Inc. received 14 sample(s) on 5/24/2013 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in red ink, appearing to read "John DuPont".

John DuPont  
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-13-10

**Lab Order:** 1305248

**CASE NARRATIVE**

Sample was analyzed using the methods outlined in the following references:

Method SW8021B - Volatile Organics by GC

Method E300 - Anions Analysis

Method M2540C - Total Dissolved Solids Analysis

**LOG IN**

The samples were received and log-in performed on 5/24/2013. A total of 13 samples were received and analyzed. The samples arrived in good condition and were properly packaged. The samples were collected in Mountain Standard Time. Samples MW-02-02 and MW-02-05 were shipped at ambient temperature as per project specs due to elevated mineral content.

**VOLATILES ORGANICS BY GC ANALYSIS**

For Volatile Organics by GC Analysis, the recovery of surrogate a,a,a-Trifluorotoluene for Sample MW-02-05 was below the method control limits, due to matrix and confirmed by reanalysis. This is flagged accordingly in the QC Summary Report. No further corrective action was taken.

For Volatile Organics by GC Analysis, Samples MW-22, MW-02-18 and MW-03-03 were diluted due to concentration of target compounds.

Order No.: 1310178

Dear Coty Woolf:

DHL Analytical, Inc. received 29 sample(s) on 10/18/2013 for the analyses presented in the following report.

Revision Number 1 for Work Order 1310178: This revision consists of correcting the sample identification from MW-18 to MW-2-18, per the client's request. Please replace the original report with this revised report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten red signature in cursive script, which appears to read "John DuPont".

John DuPont  
General Manager

This report was performed under the accreditation of the State of Texas Laboratory Certification Number: T104704211-13-11

**Lab Order:** 1310178

**CASE NARRATIVE**

Sample was analyzed using the methods outlined in the following references:

Method SW8021B - Volatile Organics by GC  
Method SW6020A - Metals Analysis  
Method SW7470A - Mercury Analysis  
Method E300 - Anions Analysis  
Method M2320B - Alkalinity Analysis  
Method M2540C - Total Dissolved Solids Analysis

**LOG IN**

The samples were received and log-in performed on 10/18/2013. A total of 29 samples were received and analyzed. The samples arrived in good condition and were properly packaged.

**ANIONS ANALYSIS**

For Anions Analysis, the recovery of Chloride for the Matrix Spike and Matrix Spike Duplicate (1310178-02, 13101778-17 MS/MSD) was slightly below the method control limits. Additionally, the recoveries of Chloride and Sulfate for the Matrix Spike and Matrix Spike Duplicate (1310178-25 MS/MSD) were outside of the method control limits. These are flagged accordingly in the QC Summary Report. These anions were within method control limits in the associated LCS. The reference sample selected for the QC Sample was from this work order. No further corrective action was taken.

**TOTAL DISSOLVED SOLIDS ANALYSIS**

For Total Dissolved Solids Analysis, the RPD of the Sample Duplicate (1310178-29 Dup) was slightly above the method control limit. This is flagged accordingly in the QC Summary Report. The associated LCS was within method control limits. No further corrective action was taken.

**METALS ANALYSIS**

For Metals Analysis, performed on 10/21/2013, the recovery of Sodium for the Continuing Calibration Verification (CCV1-131021) was below the method control limits. This is flagged accordingly in the QC Summary Report. The associated samples are batch QC only, no field samples were affected. No further corrective action was taken.

For Metals Analysis, performed on 10/21/2013 and 10/28/2013, the recovery of Potassium for the Low

---

**CLIENT:** Larson & Associates  
**Project:** Frontier ABO  
**Lab Order:** 1310178

## CASE NARRATIVE

Level Calibration Verification (LCVL1-131021, LCVL2-131028) was above the method control limits. These are flagged accordingly in the QC Summary Report. This analyte was detected in the associated samples at greater than 10x the amount detected in the LCVLs. No further corrective action was taken.

For Metals Analysis, performed on 10/21/2013 and 10/22/2013, the recoveries of several analytes for the Matrix Spike and Matrix Spike Duplicate (1310178-09, 1310178-24 MS/MSD) were outside of the method control limits. Additionally, the RPD of Selenium of the for the Matrix Spike Duplicate (1310178-24 MSD) was above the method control limit. These are flagged accordingly in the QC Summary Report. These analytes were within method control limits in the associated LCS. No further corrective action was taken.

For Metals Analysis, the recovery of Silver for the Post Digestion Spike (1310178-09 PDS) was marginally below the method control limits. This is flagged accordingly in the QC Summary Report. This analyte is within method control limits in the associated Serial Dilution. No further corrective action was taken.

For Metals Analysis, the response factor of various Internal Standards for three samples, bracketing and Batch QC samples were outside of the specifications for method SW6020A, due to matrix interference. No further corrective action was taken.

Permit Number: Evaluation of Empire Abo Gas Processing Plant remediation Plan

Larson and Associates Inc  
Attn: Jeremy J. C. Cannady  
507 North Marienfeld, Suite 202  
Midland Texas 79701

**GREETINGS:**

The Hydrology evaluation for the remediation plan you submitted concerning the Empire Abo Gas Processing station concluded there was mounded water under the plant and the planned pumping would not cause effects to the Pecos River. You may proceed with the plan and can submit an application to appropriate and any necessary well permits if required.

Sincerely,

A handwritten signature in black ink that reads "Tim Williams".
