Expected Production Explanation:

Looking at several recent Fruitland Coal (FC) offset producers, determined an expected original FC production rate around 50 mcf/d with an average dewatering stage of 2-1/2 years at a 7% /mo increase in gas. Afterwards, based on older FC offset production, an expected decline in gas rate of 20% a year was used.

Allocation Explanation:

Four Star Oil & Gas proposes to use an allocation calculated through the 'subtraction' method. Baseline production of the Mesaverde (MV) and decline will be established from existing production. The incremental production from the FC will be used to determine an appropriate allocation factor for the new zone. Please see the attached plot of the existing MV production.

Bottom Hole Pressure Explanation:

Currently, the LM Barton 1C is producing from the Point Lookout and Menefee portions of the Mesaverde with a bottom hole pressure of 250#. After completing in the Fruitland Coal, initial bottom hole pressure of 379#, based on a recent nearby offset FC producer, is expected. It should be noted, that the LM Barton 1C is on compression with expected suction pressure to be ~20# and will be on rod pump. This will allow the produced fluids to be pumped off and the gas to travel up through the casing-tubing annulus. Four Star Oil & Gas does not expect any crossflow between the two zones as the compressor will be the low pressure in which for the gas to flow up the casing/tubing annulus and the fluid to be pumped off.

**Based on offset recent FC completions.
