LIST OF FIGURES

Figure

- 1** Site Map
- 2** Groundwater Surface Elevation, December 2011
- 3** Distribution of PSH on Groundwater, December 2011
- 4** Distribution of BTEX Compounds in Groundwater, December 2011
- 5** Distribution of Inorganic Constituents in Groundwater, December 2011

LIST OF TABLES

Table

- 1** Summary of Groundwater Surface Elevations
- 2** Summary of Groundwater Analyses - Organics and Field Measured Parameters
- 3** Summary of Groundwater Analyses – Inorganics
- 4** Summary of SVE System Vapor Concentration Monitoring
- 5** Summary of Completion Details for Soil Borings Completed as Wells
- 6** Monitor Well Sampling Locations, Frequency, and Sample Analysis Plan

LIST OF APPENDICES

Appendix

- A.** Hydrograph for Selected Monitoring Wells with No Accumulated PSH
- B.** Hydrographs for Wells with Accumulated PSH
- C.** Concentration History Plots, Benzene and pH
- D.** Concentration History Plots, TDS and Chloride
- E.** Concentration History Plot, SVE System
- F.** Laboratory Reports for Soil Vapor Samples
- G.** Laboratory Reports for Groundwater Samples

1. Introduction

The last report of groundwater remediation activities covered activities completed through December 2010. This report presents a summary of monitoring and remediation activities completed between January 2011 and December 2011.

2. Groundwater Monitoring Activities

2.1 Semi-Annual Groundwater Sampling Events

Two semi-annual groundwater sampling events have been completed during the reporting period. These events were completed in May 2011 and December 2011.

Prior to sampling, the depth to water, and the depth to hydrocarbon where phase-separated hydrocarbons (PSH) were present, was determined for each monitoring well. The measured depth to water and the corresponding water table elevation for each monitoring well is presented in Table 1.

In the course of each sample event, groundwater samples were collected from selected monitoring and soil vapor extraction (SVE) wells in accordance with the sampling analysis plan. In addition, groundwater samples were collected from the on-site water well. Samples were not collected from wells with accumulated PSH in the well casing. Groundwater samples were delivered to a laboratory for analysis for benzene, toluene, ethylbenzene, and xylene (BTEX) by EPA Method 8021B, selected metals by EPA Method 6010B, total dissolved solids (TDS) by SM 2540C, and chlorides by EPA Method 300.0.

A summary of laboratory results for BTEX constituents and field measured groundwater quality parameters (pH, temperature, electrical conductivity and dissolved oxygen) is presented in Table 2. A summary of laboratory results for inorganic constituents is presented in Table 3. A copy of the laboratory reports is included in Appendix G.

2.2 Results/Conclusions from Groundwater Sampling Events

2.2.1 Occurrence and Direction of Groundwater Flow

A water table elevation map based on measurements obtained in the course of the December 2011 sampling event is included as Figure 2. The apparent direction of groundwater flow is toward the southeast and is consistent with water table elevation maps previously developed for this site.

A hydrograph for selected monitoring wells with no accumulated PSH is included in Appendix A. The hydrograph presents a history of water table elevation change since depth to water measurements were first recorded at the site in 1993. It is apparent from the hydrograph that the water table elevation has fluctuated by less than about 0.5 feet during the recorded timeframe.

2.2.2 Lateral Extent of Phase Separated Hydrocarbon

During 2011, the lateral extent of PSH was defined by the occurrence of PSH in wells MW-4 and SVE-13. In addition, PSH occurred intermittently in wells SVE-1, SVE-3, and SVE-8. The thickness of accumulated PSH in wells is presented in Table 1 and in hydrographs presented in Appendix B.

The volume and lateral extent of PSH in the area appears to be relatively limited. The lateral distribution of PSH measured in wells in the course of the December 2011 sampling event is presented in Figure 3. Also indicated in Figure 3 is the estimated maximum extent of PSH measured at the site in December 1999. The current lateral extent of PSH covers a considerably smaller area than the estimated maximum extent indicating that the SVE system has effectively reduced the size of the impacted area.

The thickness of PSH accumulated in wells has decreased significantly since remediation efforts began in 1996. This is shown graphically in the hydrographs presented in Appendix B. The decrease in PSH thickness has been observed in all nine wells that had initially indicated PSH in the well casing. In recent years, a measurable thickness of PSH has persisted in just three wells, wells MW-4, SVE-8, and SVE-13. In December 2011, 0.04 feet of PSH was measured in well MW-4, no PSH in well SVE-8, and 0.15 feet of PSH in well SVE-13.

2.2.3 Condition of Affected Groundwater

Elevated concentrations of benzene, TDS, and chlorides continue to be the primary constituents of concern at the site. The lateral distribution of BTEX constituents dissolved in groundwater is presented in Figure 4. The lateral distribution of inorganic constituents dissolved in groundwater is presented in Figure 5.

Concentration history plots for benzene and pH at selected wells are included in Appendix C. Similarly, concentration history plots for TDS and chlorides at selected wells are included in Appendix D.

The condition of affected groundwater has not changed significantly from previous sampling events. Generally, over the previous five year period, benzene concentrations have been stable or declining at all well locations with one possible exception, at well MW-10. The benzene concentration at well MW-10 has increased slightly from 34 ug/L in December 2005 to 45 ug/L in December 2011.

Similarly, over the previous five year period, TDS concentrations have been stable or declining at all well locations with just one exception, at well MW-12. At well MW-12, the TDS concentration has increased from 860 mg/L in April 2005 to 2400 mg/L in December 2011. The TDS concentration at well MW-13, located at the downgradient toe of the plume, has remained relatively stable over the previous five year period.

3. Status of Remediation Activities

3.1 Remediation Activities Completed through December 2011

The following remediation activities were completed during the reporting period:

- 1) Operation of the SVE system is limited to the warmer weather months. Condensed water collecting in the SVE conveyance lines during cold weather made the system ineffective. The SVE system operated from June 29, 2011 through December 3, 2011.
- 2) One vapor sample was collected from the SVE system during 2011. A summary of laboratory results for the SVE system is presented in Table 4. A concentration history plot for SVE vapor samples is included in Appendix E. It is apparent from the concentration history plot that the concentration of Volatile Organic Compounds (VOCs) has declined significantly since the remediation system was first placed in-service in June 1996. Laboratory results for SVE system samples also indicate that during 2011, the system was removing VOCs from the subsurface at an estimated rate of 24 gallons equivalent per month. A copy of the laboratory report for this sampling event is included in Appendix F.

4. Proposed Modifications

4.1 Modifications to the Routine Groundwater Sampling Plan

Sampling location, frequency and the sampling analysis plan (SAP) will continue on a semi-annual basis. A summary of the sample analysis plan is presented in Table 6.

4.2 Modifications to the Remediation System

Currently there are no modifications to the remediation system scheduled for 2012, however, a comprehensive site evaluation is in progress in an effort to further define future remediation activities.

4.3 Reporting Frequency

Reporting of groundwater monitoring and remediation activities will continue on an annual basis.

NOTES:

- (a) Not applicable since no measurable thickness of hydrocarbon is present
 - (b) Corrections to ground water surface elevation for presence of hydrocarbon is calculated assuming a specific gravity of 0.8
 - (c) TOC elevation based on survey by John West Surveying Co. on 12/28/99
 - (d) TOC elevation based on survey by CES (GCR) on 01/09/98
 - (e) TOC elevation based on survey by CES (GCR) on 08/11/99
 - (f) TOC elevation based on survey by John West Surveying Co. on 12/27/99
w/adjustments: MW-2=+0.06, MW-7 & SVE-1-13=+0.08, MW-10-13=+0.02
 - (g) TOC elevation based on survey by John West Surveying Co. on 01/09/03
- *** Indicates depth measurements on this date were associated with a routine groundwater sampling event
