Re: **Corrective Action Plan (CAP)**  
Rice Operating Company – Hobbs O-29 EOL  
UL O, Sec 29, T18S, R38E  
**OCD Case No. 1R428-51**

Sent via Certified Mail w/ Return Receipt No. 7007 2560 0001 9729 0683

**Mr. Hansen:**

This letter summarizes information gained from the NMOCD approved Investigation and Characterization Plan (ICP) of January 20<sup>th</sup>, 2010 for Rice Operating Company's Hobbs O-29 EOL project and proposes a Corrective Action Plan to protect groundwater from potential future impacts from residual chlorides and hydrocarbons.

The subject site is located in west Hobbs, New Mexico. The apparent direction of groundwater flow is toward the southeast (See Appendix). The estimated depth to groundwater (the water table) is approximately 67 ft bgs.

A summary of analyses for residual soil chlorides and petroleum hydrocarbons is given in the Appendix. Petroleum hydrocarbons were significant only near the former junction box (in SB-1) near the surface and to a depth of 40 ft bgs (as evidenced by a field PID reading greater than 100). Total BTEX measured 9.24 mg/kg at 5 ft bgs and 2.80mg/kg at 40 ft bgs. Petroleum hydrocarbons were essentially insignificant in all of the other soil borings. Residual soil chlorides decreased with depth to 352 mg/kg at 70 ft bgs in SB-1, 96 mg/kg at 65 ft in SB-2, 416 mg/kg at 40 ft in SB-3, 768 mg/kg at 40 ft in SB-4, and 464 mg/kg at 40 ft in SB-5.

Although these levels of residual soil chlorides and hydrocarbons are not high, we nevertheless propose to install an impermeable, synthetic subsurface liner to protect groundwater from potential future impacts. Subject to your approval, we propose to undertake the following actions:

- 1- Excavate chloride-impacted soil over an area of approximately 52 ft x 52 ft and to a depth of approximately 4-5 ft bgs. This area extends 5 ft in all directions beyond each of the soil bores.
- 2- Install and properly seat a 20-mil, reinforced poly liner over a prepared bed of approximately 6 inches of clean blow sand, and carefully secure the liner with another 6 inches of clean blow sand below the liner.

## Rice Operating Company – Hobbs O-29 EOL

- 3- Backfill the remaining excavation with soil material having a chloride concentration no greater than 500 mg/kg and a field measurement of residual hydrocarbons no greater than 100 ppm. Any excess or soil material exceeding these standards will be properly disposed of at an NMOCD approved facility.
- 4- Restore the surface to natural grade, add amendments and seed with a blend of native vegetation mix, as necessary. Vegetation above the liner will also provide a natural infiltration barrier for the site since plants capture water through their roots thereby reducing the volume of water moving through the vadose zone to groundwater.

The MultiMed simulation model was run to estimate whether residual chlorides pose a potential threat to groundwater quality following the installation of the liner. Input parameter values are given in the Appendix where the infiltration parameter value used is that of a “good” liner (0.00762 m/yr). The projected maximum potential impact (increase) in groundwater chloride concentration 1 m downgradient from the former junction box (EOL) is 79 +/- mg/L at approximately 176 +/- years into the future (Appendix – MultiMed Chloride graph and report).

The MultiMed simulation model was also run to estimate whether residual soil BTEX poses a potential threat to groundwater quality following the installation of the liner. Input parameter values are given in the Appendix where the infiltration parameter value used is indicative of no liner (0.03048 m/yr). The projected maximum potential impact (increase) in groundwater BTEX concentration beneath the former junction box (EOL) is 0.0029+/- mg/L at approximately 41 +/- years into the future (Appendix – MultiMed BTEX graph and report). This total BTEX value is less than the WQCC standard for each of the BTEX constituents (0.010 mg/l for benzene, 0.750 mg/l for toluene, 0.750 mg/l for ethylbenzene and 0.620 for xylenes).

These MultiMed simulations indicate that residual chloride and BTEX will not, in any way, affect groundwater quality beneath the site. Therefore, upon completion of the vadose zone remediation, ROC will submit a written report providing documentation of CAP activities, and, in this report, request remediation termination status for this project.

ROC is the service provider (agent) for the Hobbs SWD System and has no ownership of any portion of the pipeline, well, or facility. The System is owned by a consortium of oil producers, System Parties, who provide all operating capital on a percentage ownership/usage basis.

Please do not hesitate to contact either Rice Operating Company or myself if you have any questions or need additional information.

Thank you for your consideration.

Sincerely,

L. Peter Galusky, Jr. Ph.D.  
Principal

## Hansen, Edward J., EMNRD

---

**From:** Katie Jones <kjones@riceswd.com>  
**Sent:** Tuesday, August 27, 2013 2:04 PM  
**To:** Hansen, Edward J., EMNRD  
**Cc:** Hack Conder; L Peter Galusky; Laura Pena  
**Subject:** ROC - Hobbs O-29 EOL (1R428-51) CAP Addendum  
**Attachments:** ROC - Hobbs O-29 EOL (1R428-51) Proposed Liner.jpg

Mr. Hansen,

This email is an Addendum to the Hobbs O-29 EOL (1R428-51) Corrective Action Plan (CAP), submitted to the NMOCD on August 8, 2013. Pages 1 and 2, paragraph 4, points 1-4: text in blue lettering, below, will be added to the paragraph. Red lettering marked with a strike-through will be deleted. A plat showing the updated liner dimensions is attached.

“Although these levels of residual soil chlorides and hydrocarbons are not high, we nevertheless propose to install an impermeable, synthetic subsurface liner to protect groundwater from potential future impacts. Subject to your approval, we propose to undertake the following actions:

- 1- Excavate chloride-impacted soil ~~over an area of approximately 52 ft x 52 ft and to a depth of approximately 4.5 ft bgs~~ surrounding the O-29 EOL site. There are pipelines running through the site preventing the installation of a single liner; a buried injection line running north-south and a buried pipeline running east-west. In order to remain a safe distance from those pipelines, ROC will excavated four separate areas to a depth of 4-5 ft bgs and install four separate 20 mil, reinforced liners. Each liner extends 5 ft in all directions beyond each of the soil bores. The northwest liner will measure approximately 34x14-ft, the northeast liner will measure approximately 33x32-ft, the southwest liner will measure approximately 12x14-ft, and the southeast liner will measure approximately 13x32-ft. Each excavation will remain at least 3 ft or a safe distance away from the pipelines.
- 2- Install and properly seat a 20-mil, reinforced poly liner in each of the excavations ~~over a prepared bed of approximately 6 inches of clean blow sand, and carefully secure the liner with another 6 inches of clean blow sand below the liner~~.
- 3- Backfill the remaining excavations with soil material having a chloride concentration no greater than 500 mg/kg and a field measurement of residual hydrocarbons no greater than 100 ppm. Any excess or soil material exceeding these standards will be properly disposed of at an NMOCD approved facility.
- 4- Restore the surface to natural grade, add amendments and seed with a blend of native vegetation mix, as necessary. Vegetation above the liner will also provide a natural infiltration barrier for the site since plants capture water through their roots thereby reducing the volume of water moving through the vadose zone to groundwater.”

If you need any further information, please let me or Hack know.

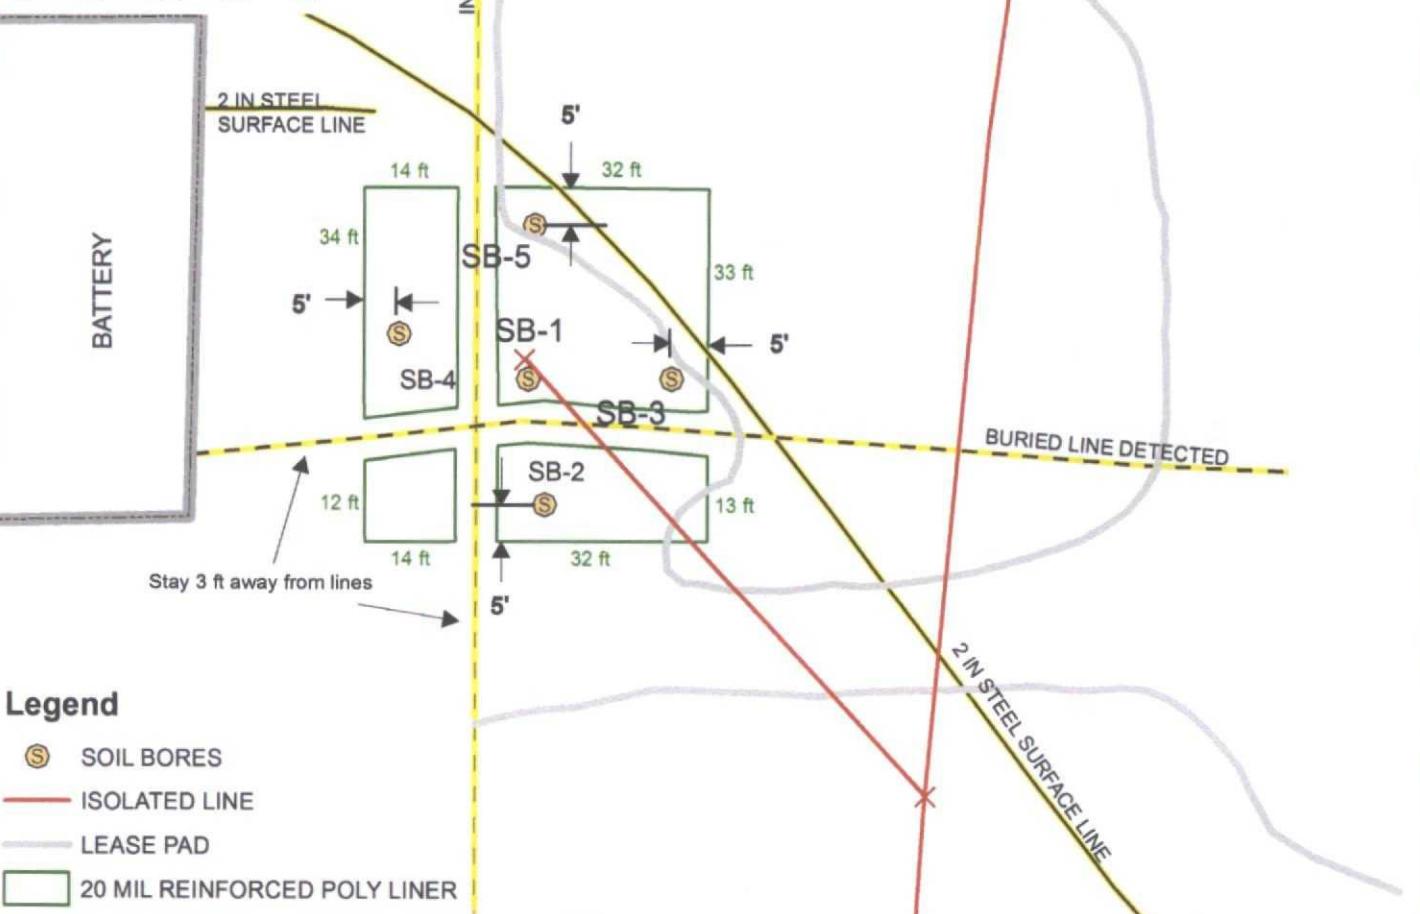

Thank you.

Katie Jones
